

# TESLA Project Overview

## Advantages of superconducting cavities for a linear collider

Due to low RF losses in the walls of  
s.c. cavities

- High conversion efficiency from mains to beam power
- Long RF pulse possible
  - Many bunches spaced far apart allowing
    - head on collision
    - fast bunch to bunch orbit feedback

Luminosity of e+/e- collider is given by:

$$L \approx \text{const} \cdot H \cdot P \frac{\sqrt{\delta}}{E} \frac{\eta}{\sqrt{\epsilon}}$$

- H Luminosity enhancement factor caused by selffocussing
- E cm energy of collider
- $\delta$  average beamstrahlungs loss
- P mains power
- $\eta$  conversion efficiency mains to beam power
- $\epsilon$  normalised vertical emittance at IP

To achieve high luminosity

high conversion efficiency

and

small vertical emittance at I.P.

are needed

A very relevant quantity in optimizing the performance of a Linac is the shunt impedance per unit length

$$\frac{(\text{Accelerating Gradient})^2}{\text{RF loss per unit length}}$$

This quantity depends on RF frequency  $\omega$   
for normalconducting acc. structures

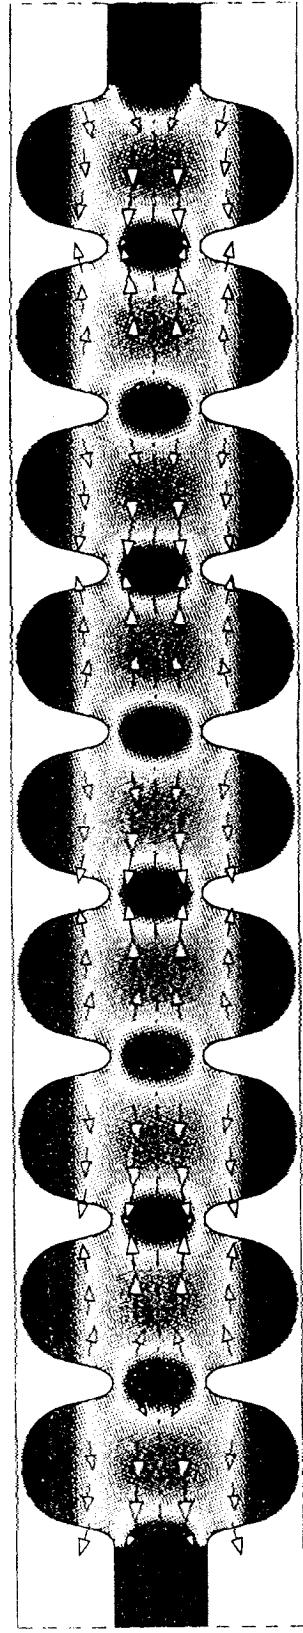

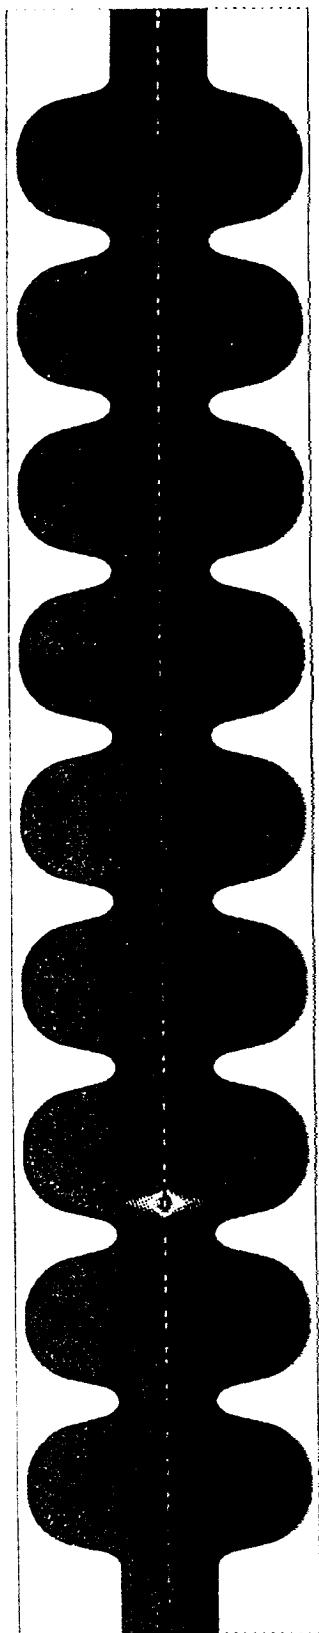

$$\sim \sqrt{\omega}$$

Thus favouring high RF frequencies

For superconducting acc. structures it scales approximately like

$$\frac{\omega}{A\omega^2 + B}$$

Favouring RF frequencies around  
 $\sim 1 \text{ GHz}$

## TRANSVERSE WAKEFIELDS

$$W_{\perp} \sim \omega^3$$

At high beam intensities more severe limits on trajectory correction are required due to transverse wakefield-induced emittance enlargement. Effects of wakefields are clearly seen, as indicated in Fig. 6 where oscillations of 1 mm cause severe beam blowup at  $2 \times 10^{10}$  electrons per bunch.

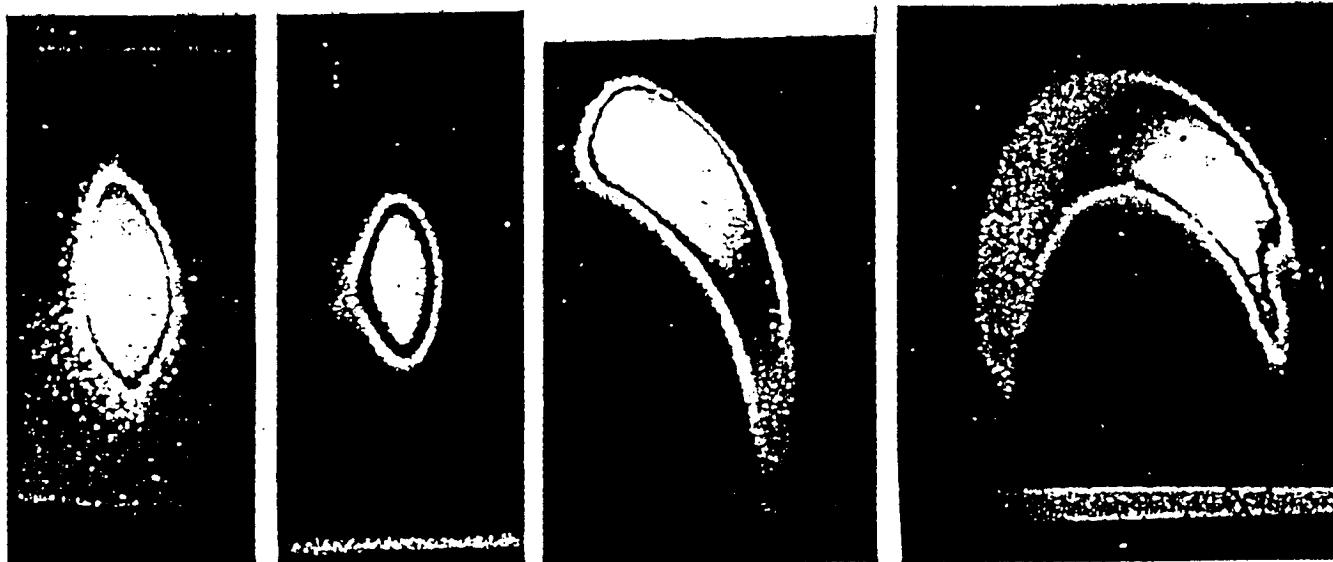

FIGURE 6 Images of an  $e^-$  beam on a profile monitor showing wakefield growth with increasing oscillation amplitude. The left image is for a well-steered beam and the right one for an oscillation amplitude of 1 mm. The beam intensity is  $2 \times 10^{10}$  electrons. The core sizes  $\sigma_x$  and  $\sigma_y$  are about 120  $\mu\text{m}$ .

As low RF frequencies are preferred  
for s.c. cavities

→ Ideally suited to accelerate  
low emittance beam  
as emittance dilution by wakefields  
is small               $W_{\perp} \sim \omega^3$

$$L \sim \frac{\eta}{\sqrt{\epsilon}}$$

The combination of high conversion  
efficiency from mains to beam power  
and small emittance dilution make  
superconducting linear collider the  
ideal choice with respect to achievable  
luminosity

Major challenges to be mastered  
so that superconducting linear collider  
becomes feasible:

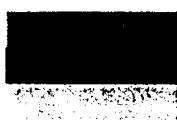

- Increase of gradient from ~5 MV/m  
to 25MV/m
- Cost reduction of structure per meter  
by ~4 to achieve 2000\$/MV

Encouraged by R&D results from  
CEBAF,CERN,Cornell,DESY,KEK,Saclay  
and Wuppertal

nucleus of TESLA collaboration decided  
in 1991 to set up infra structure at DESY

necessary to process and test 1.3Ghz sc  
Niobium cavities produced by industry

Work on concept of superconducting linear collider was pursued

Energy 500 GeV

RF frequency 1.3 GHz

Gradient 25 MV/m

Q-value  $5 \cdot 10^9$   $L \sim 5 \cdot 10^{33} \text{ cm}^{-2} \text{ sec}^{-1}$

Conceptual design report (CDR) was published in 1997

Two sites: DESY and FERMILAB

complete description of collider including all subsystems

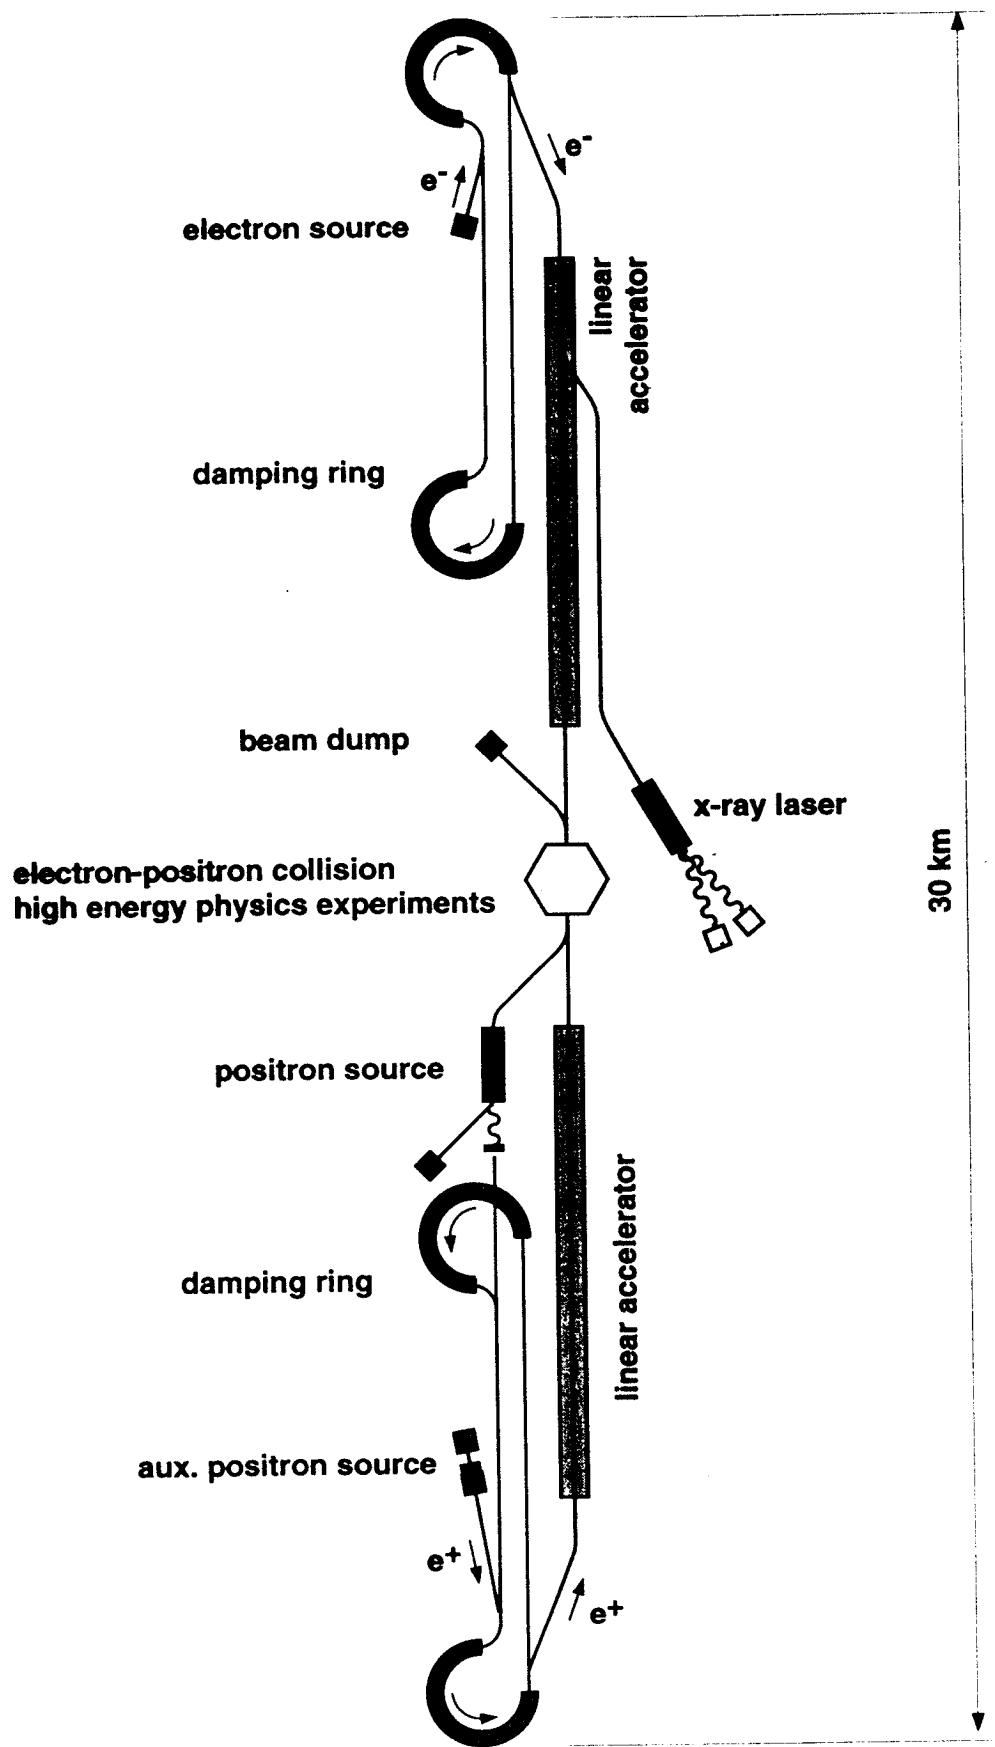

includes joint study with ECFA on particle physics and detector

Since 1990 growing interest in X-ray FEL based on SASE principle

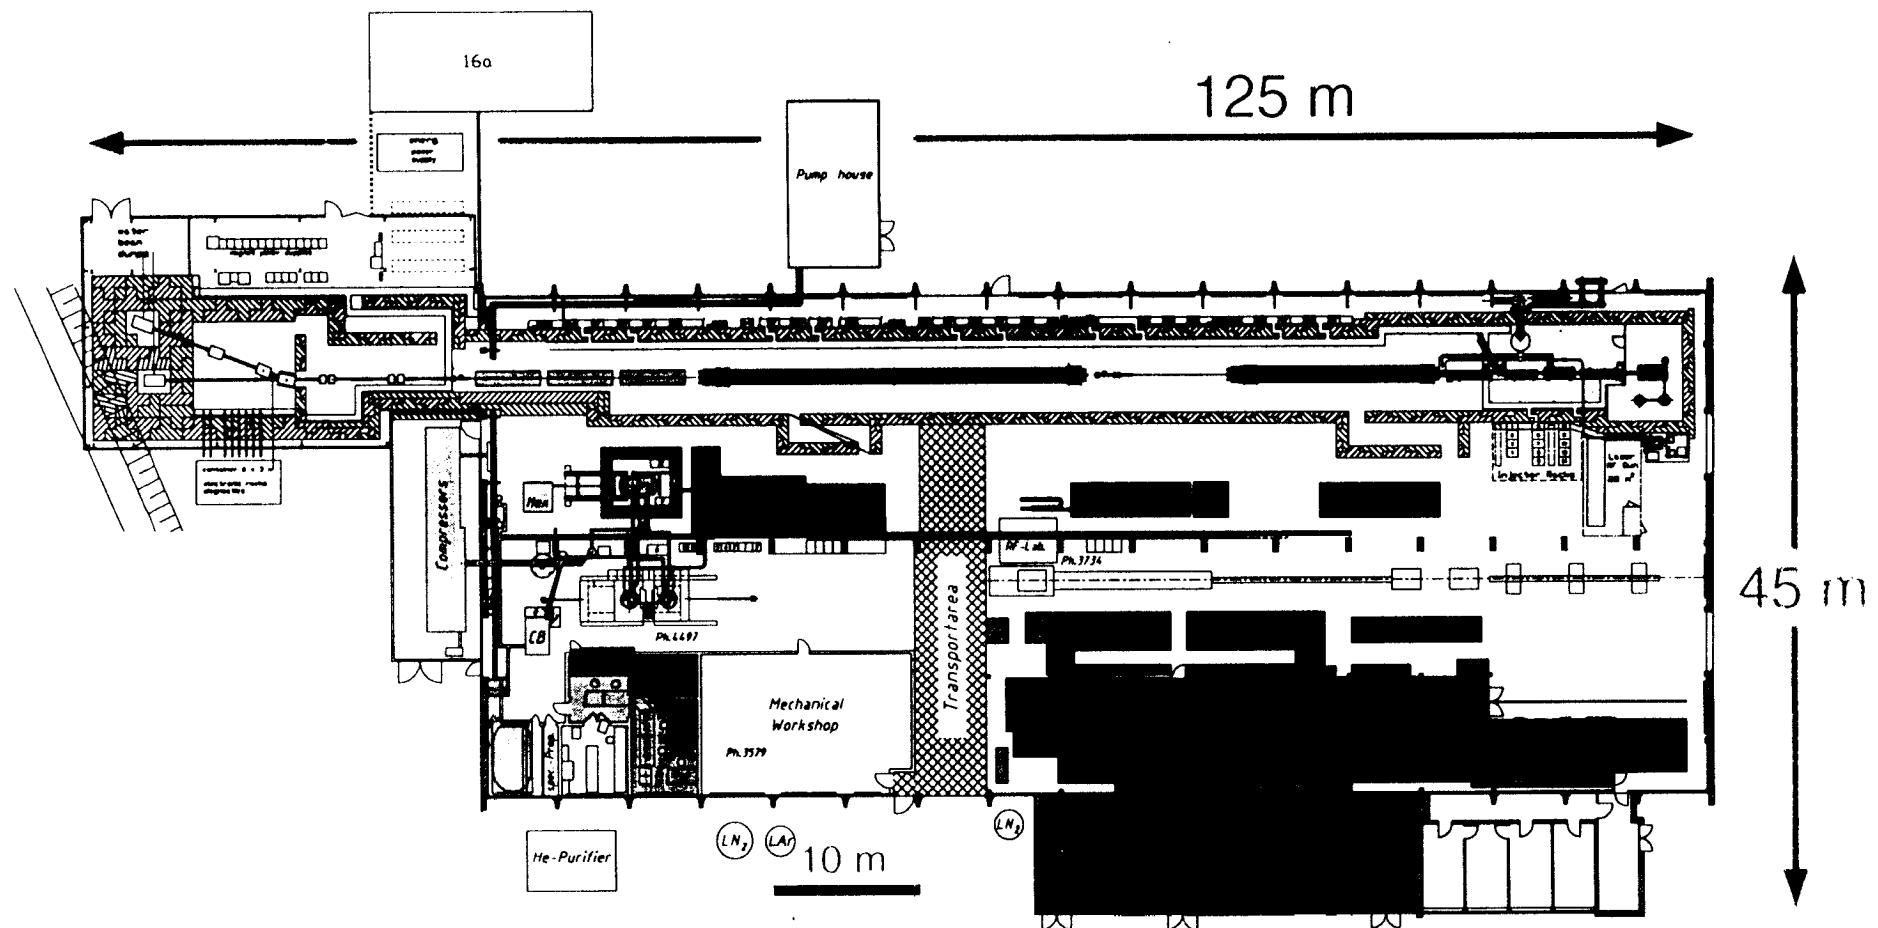

Requirements on emittance very demanding  
→ s.c. structures ideal for acceleration

CDR includes layout of X-ray FEL facility

integrated into the linear collider facility

# TESLA TEST FACILITY (HALL 3)

- Cavity Treatment and Assembly
- Cavity Testing (RF System / He Plant )
- TTF Linac

Initial goal for the TESLA Test Facility TTF

gradient 15 MV/m

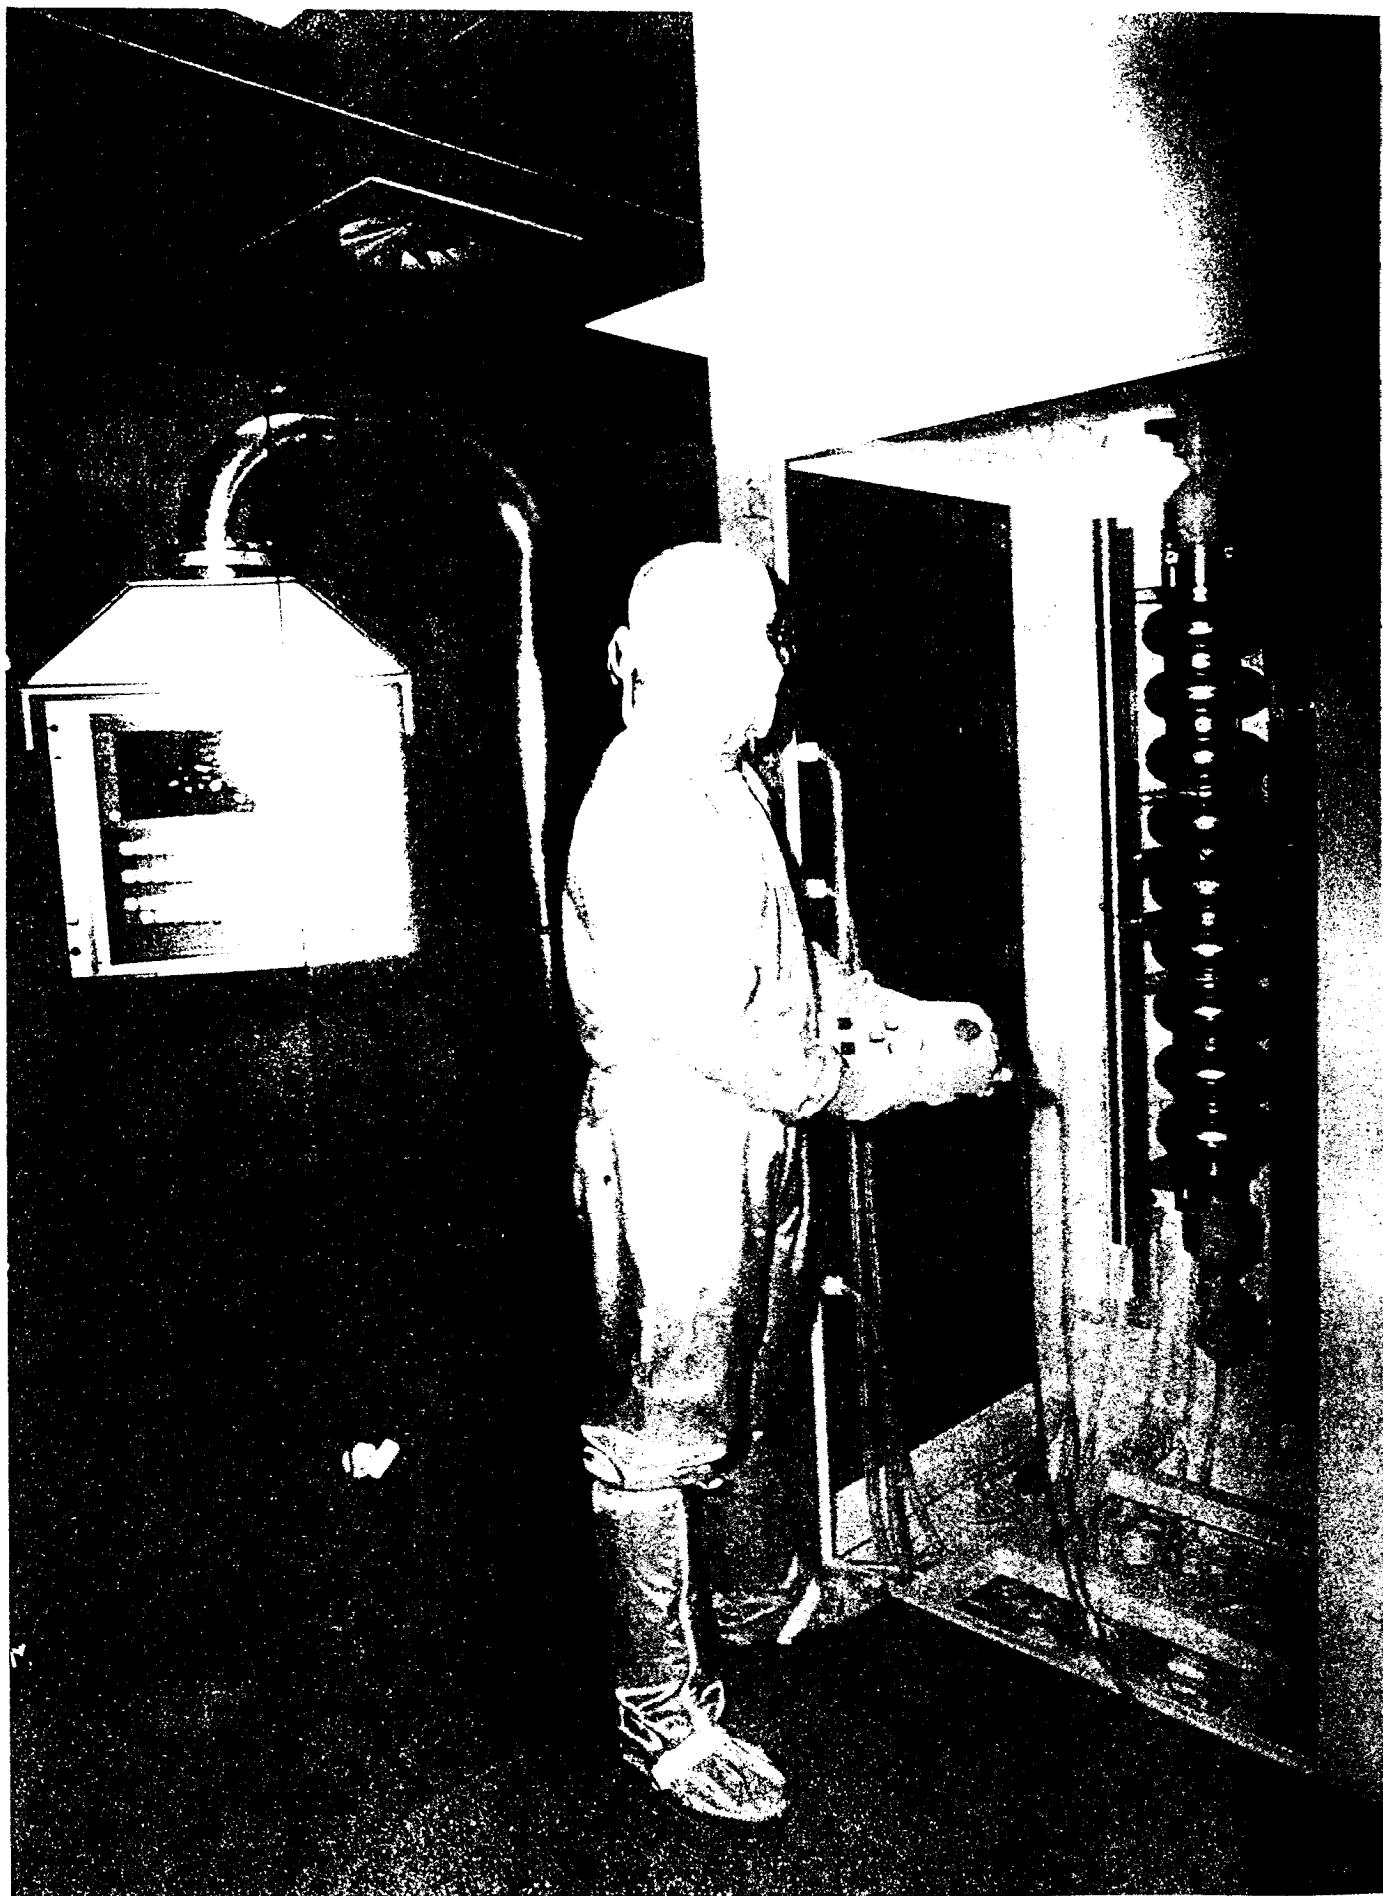

Q-value  $3 \cdot 10^9$

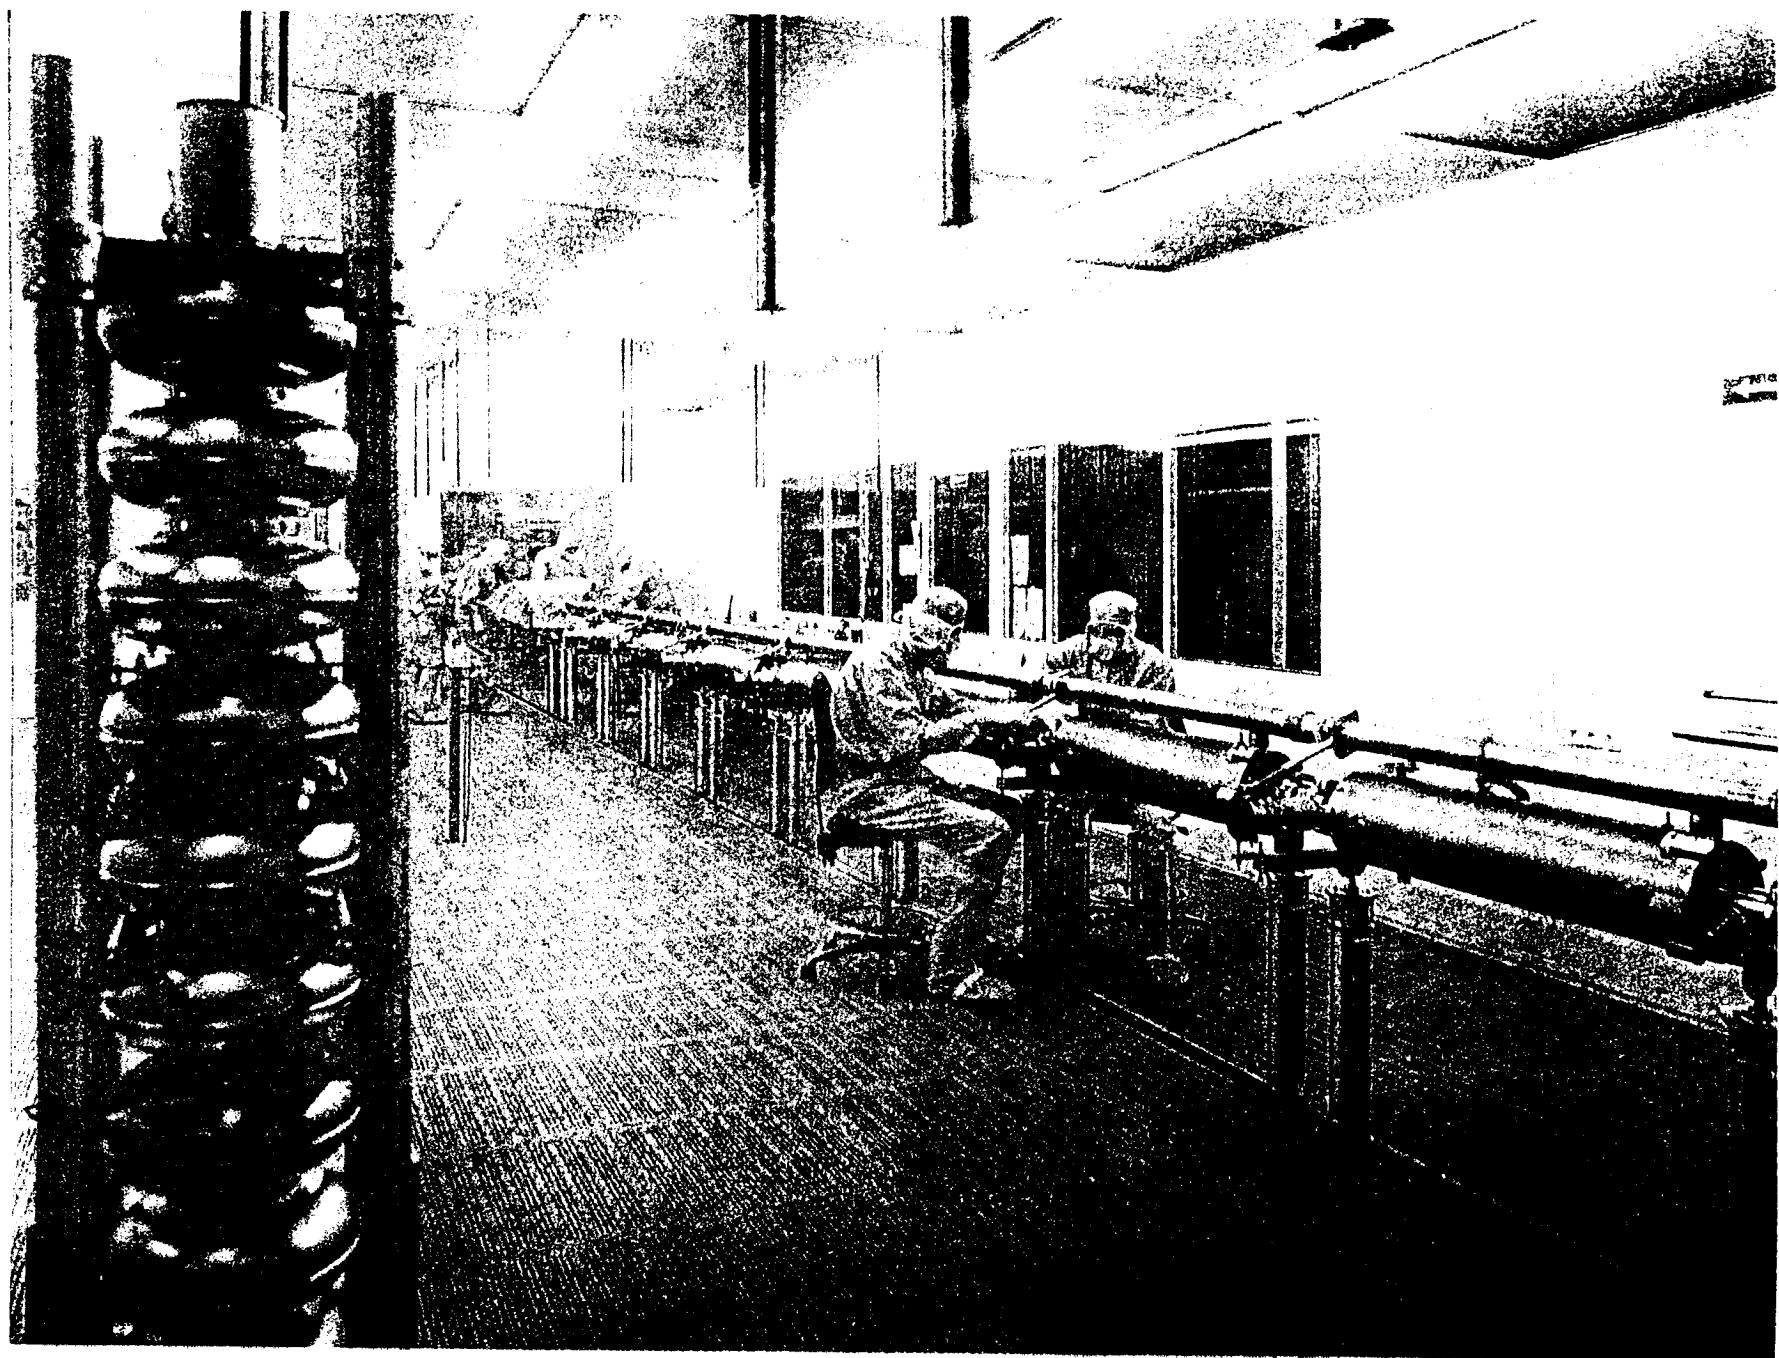

### Infrastructure

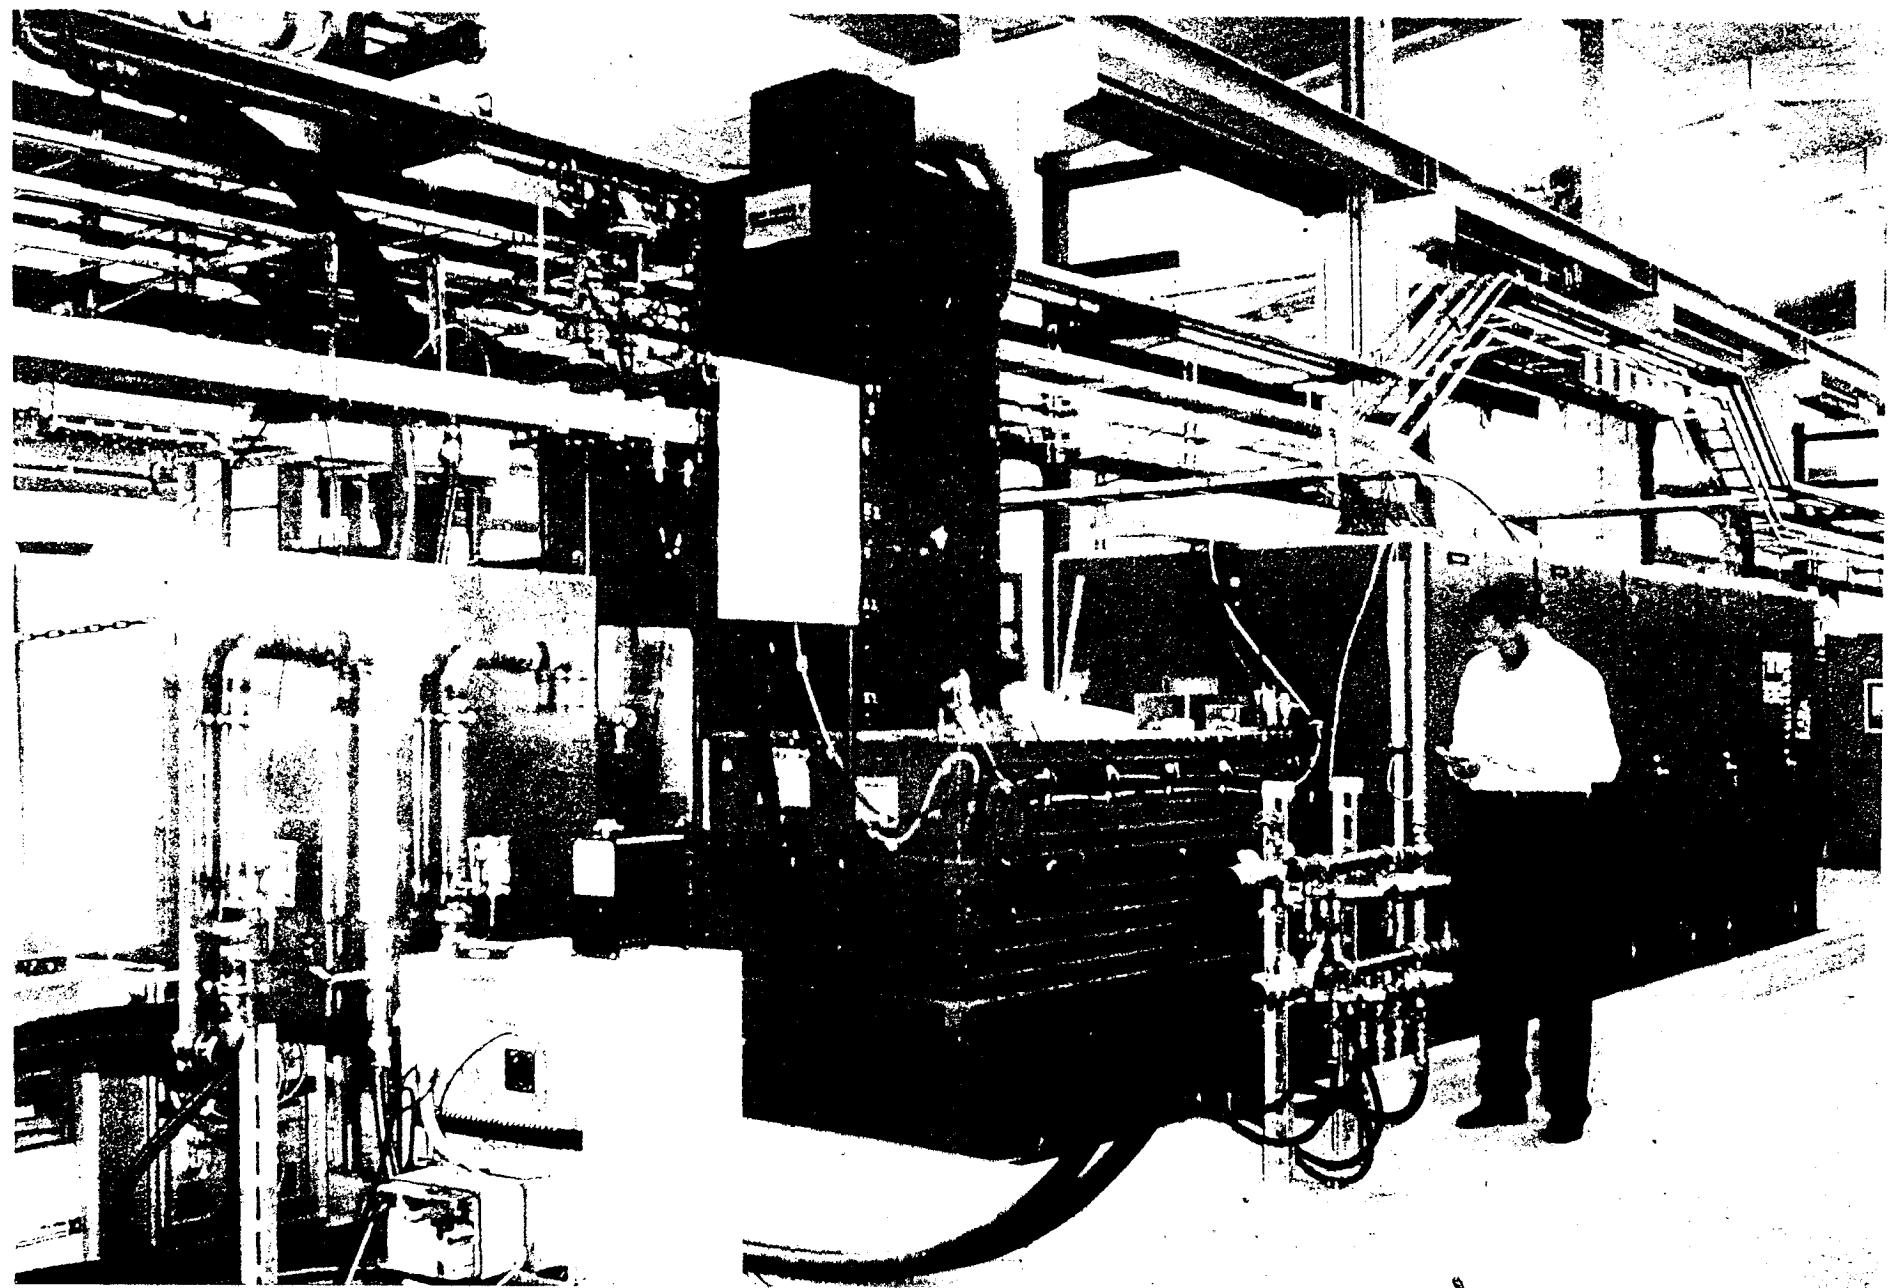

cleanrooms automatic chemistry high pressure rinsing	with substantial help of CERN
furnace 1500 C	Cracow
cryogenics for 1.8 K	substantial contributions by Fermilab
2 vertical Test kryostats	Fermilab
horizontal Test kryostat	Saclay
1.3 GHz RF system	Fermilab

FIRST SERIES OF CAVITIES DESY/JINU/SACLAY

COUPLERS FERMILAB  
FROM COUPLERS SACLAY / DESY  
TUNERS SACLAY

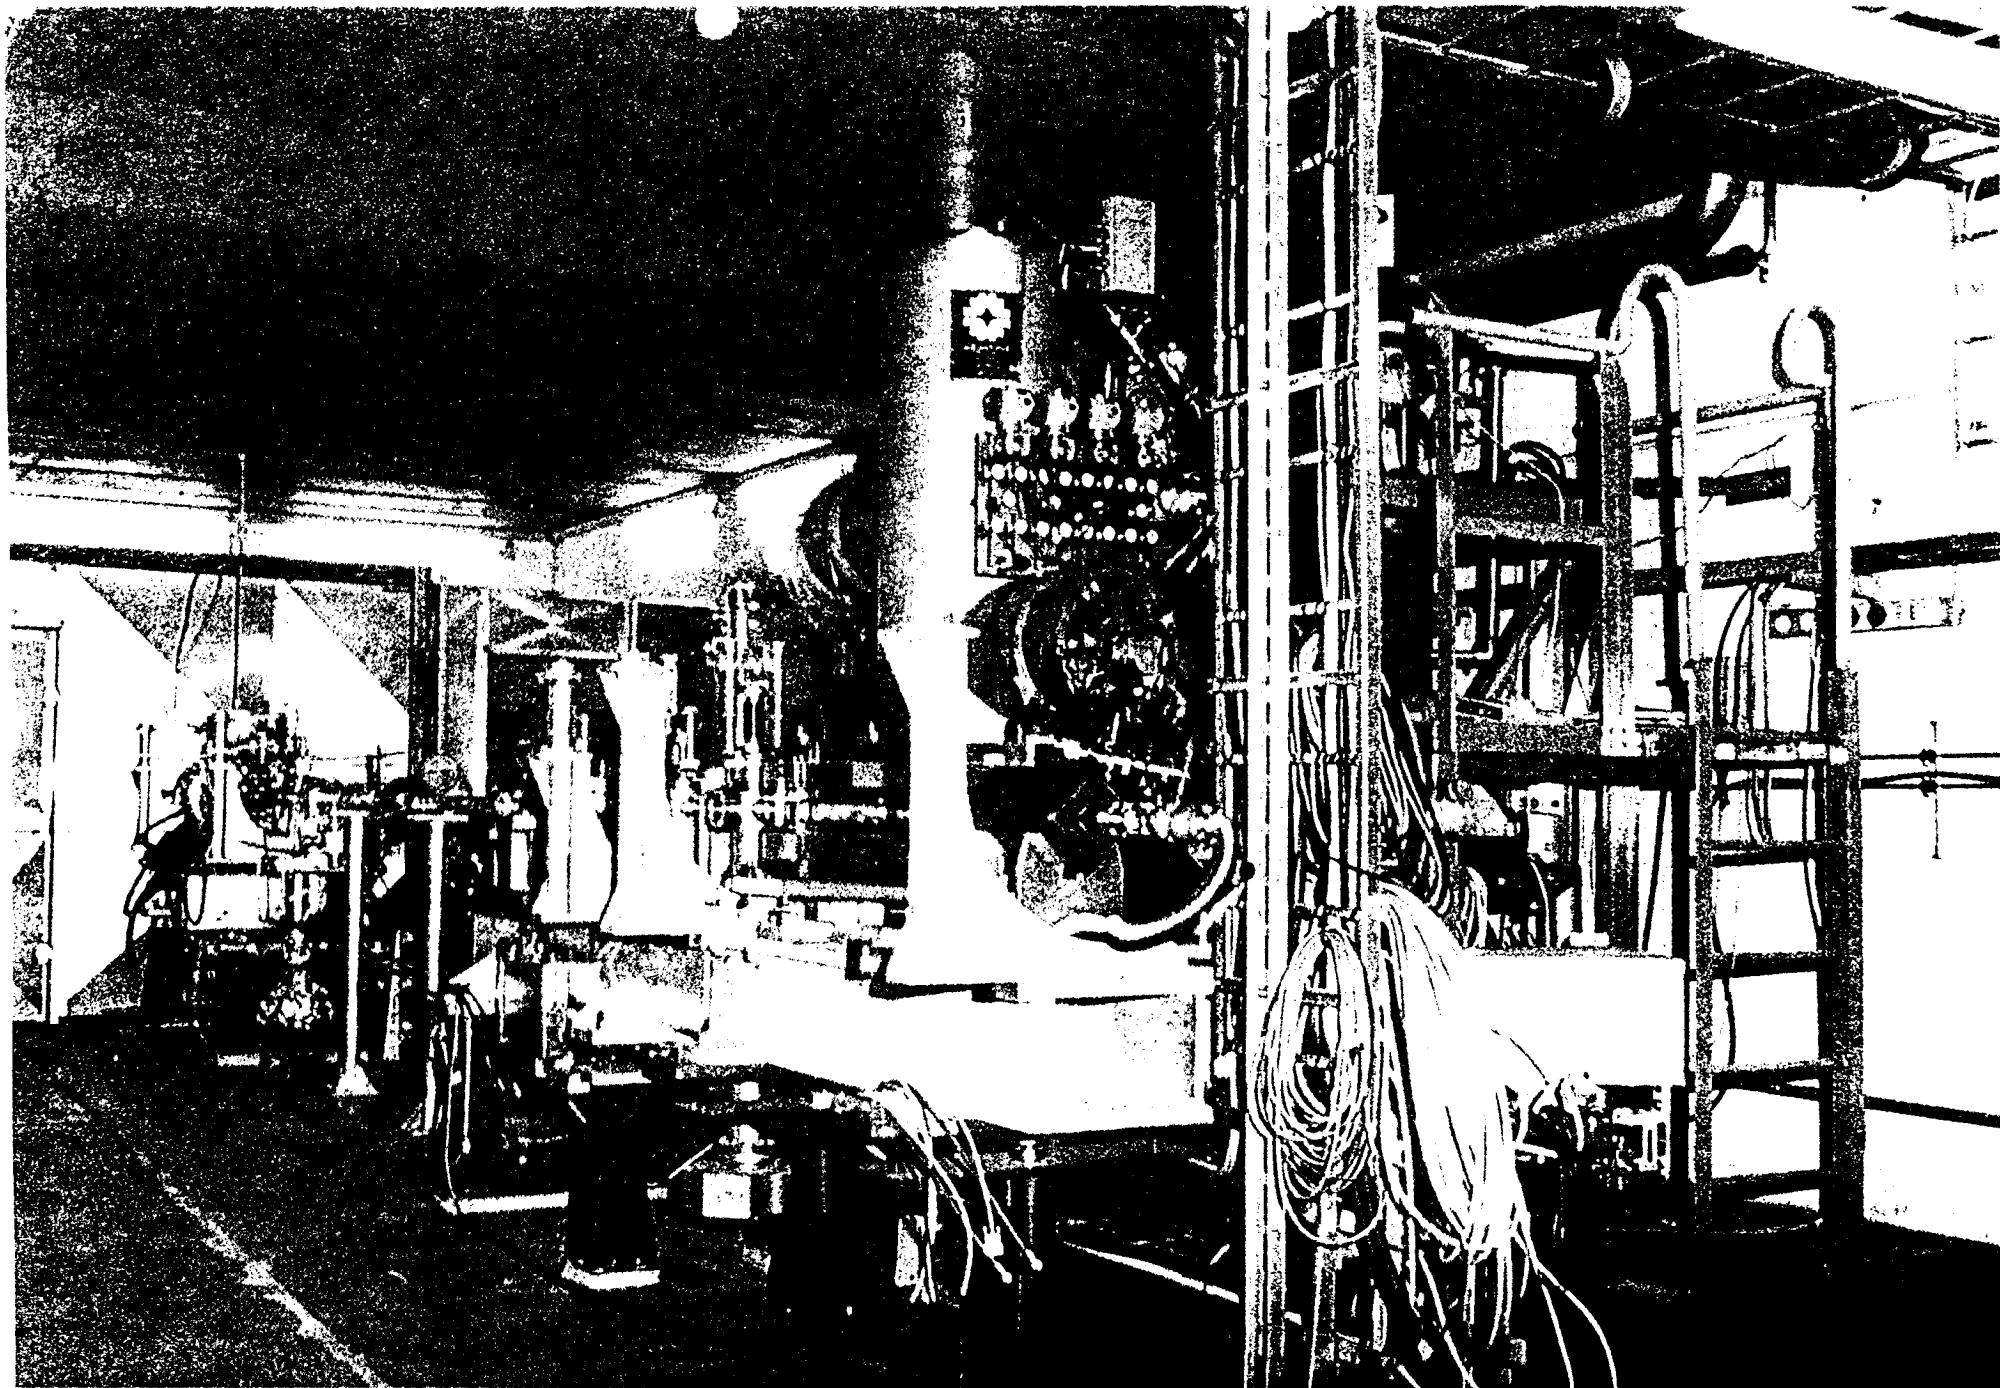

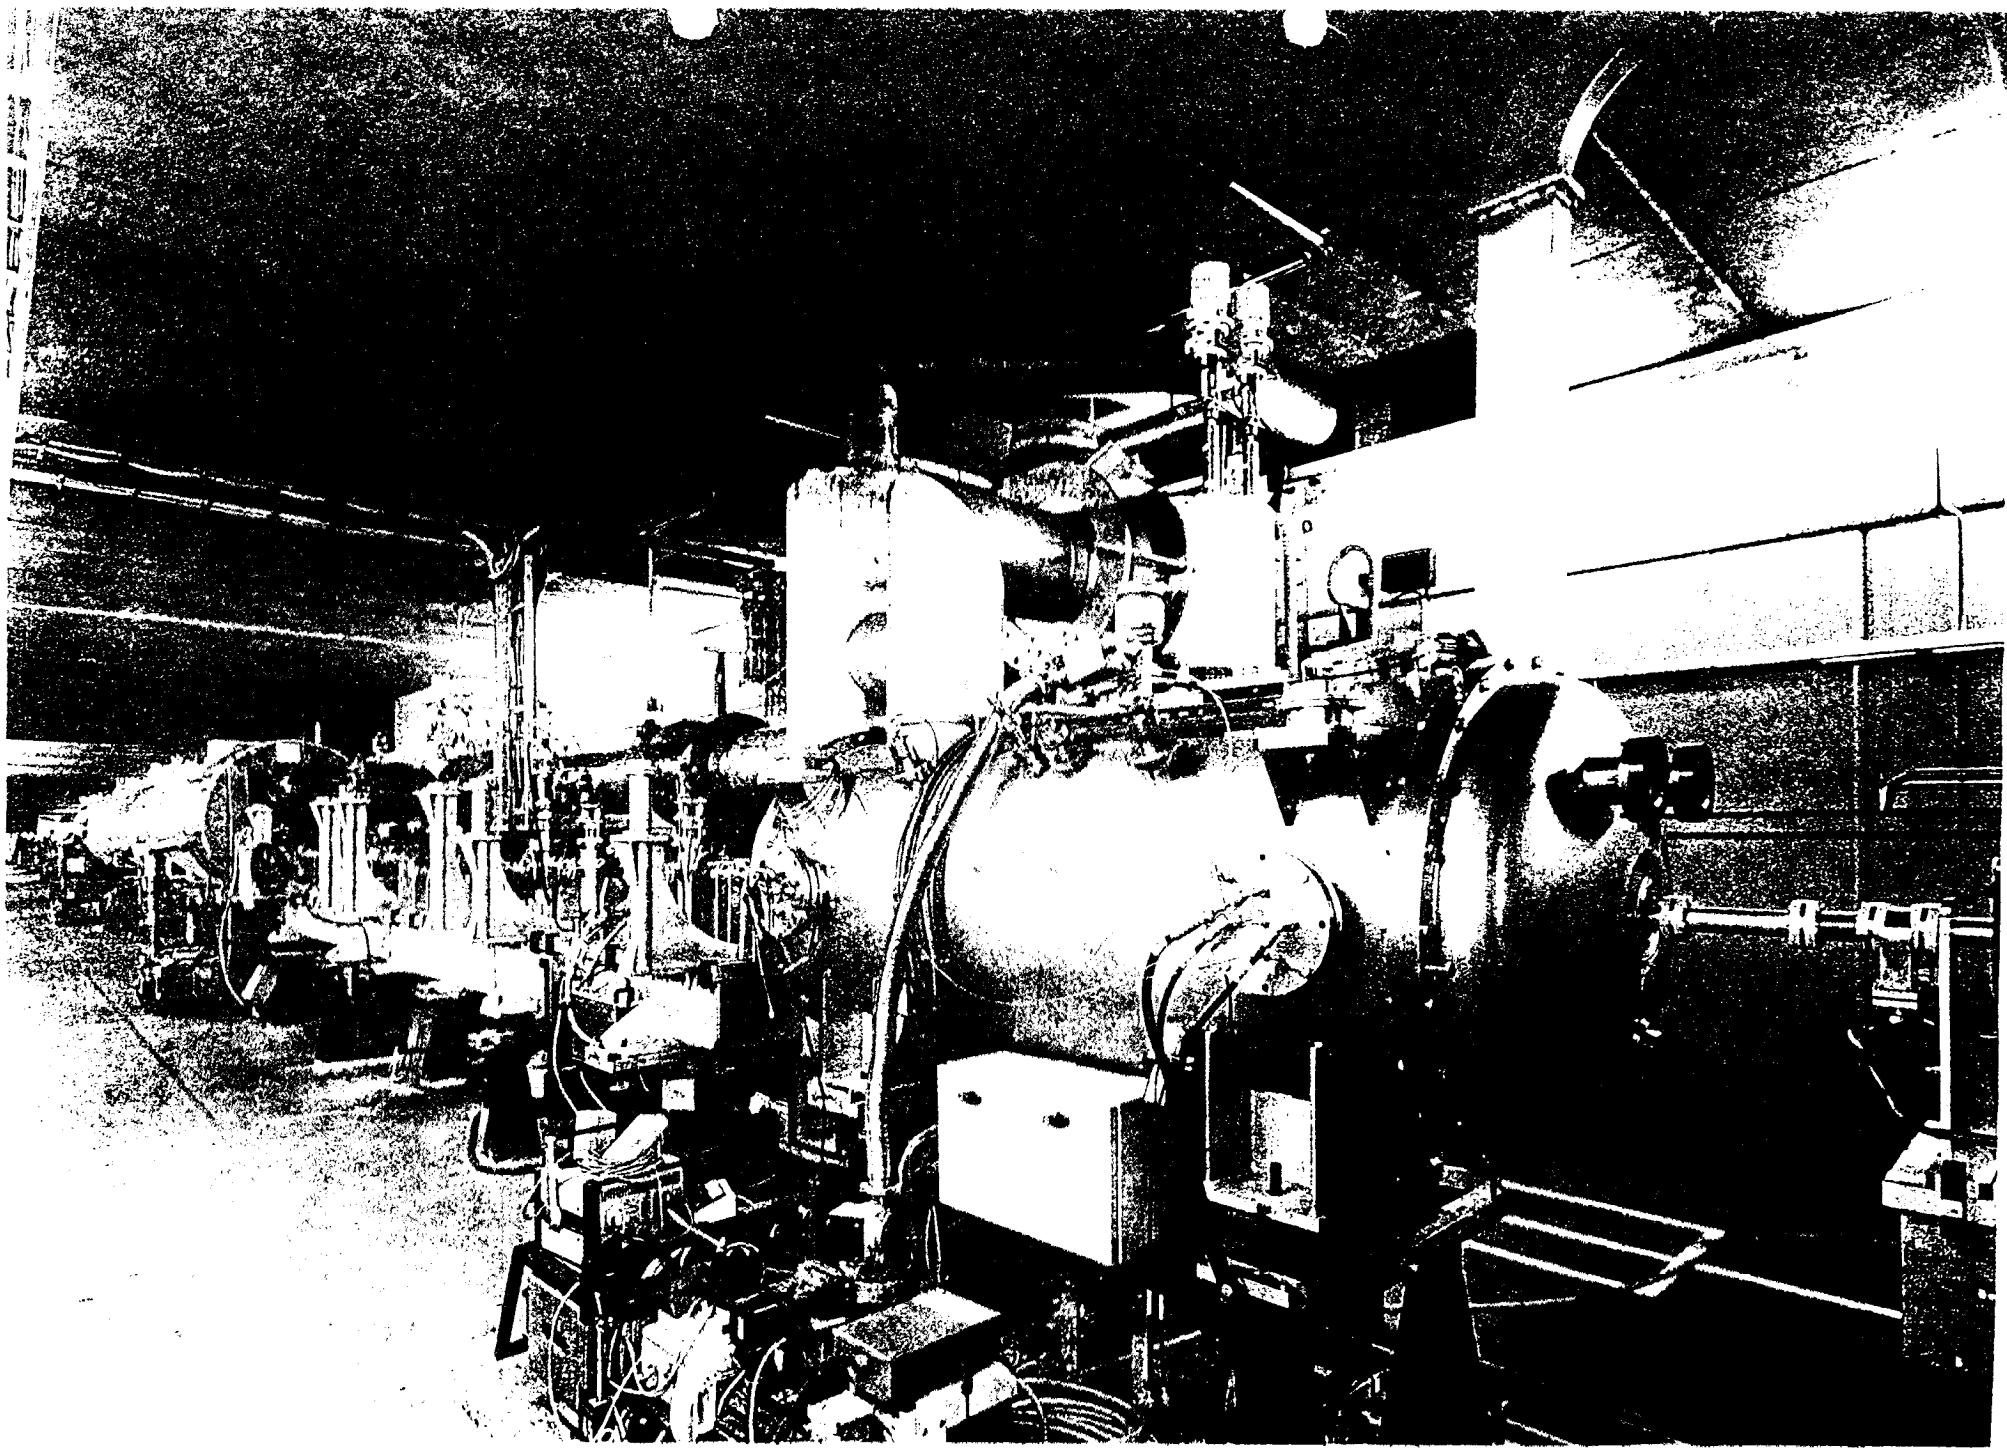

# Test Linac

as an integrated systems test to demonstrate  
that a linear collider based on s.c. cavities  
can be constructed and operated with confidence

Max Born Inst. UCLA Fermilab INFN	RF-Gun
Orsay Saclay	Injector
INFN Fermilab	4 Cryostat Modules
TU Berlin Cracow INFN Orsay Protvino Yerevan	Instrumentation Controls
Protvino	Beam Dumps
Dubna Fermilab INFN Protvino Yerevan	Magnets
Fermilab Protvino Orsay	Cryogenics

Ingredients for cost reduction:

- Long cavities 9 cells

- Fewer input couplers  
HOM couplers  
Tuners  
Vacuum vessel penetrations  
Waveguides

.

.

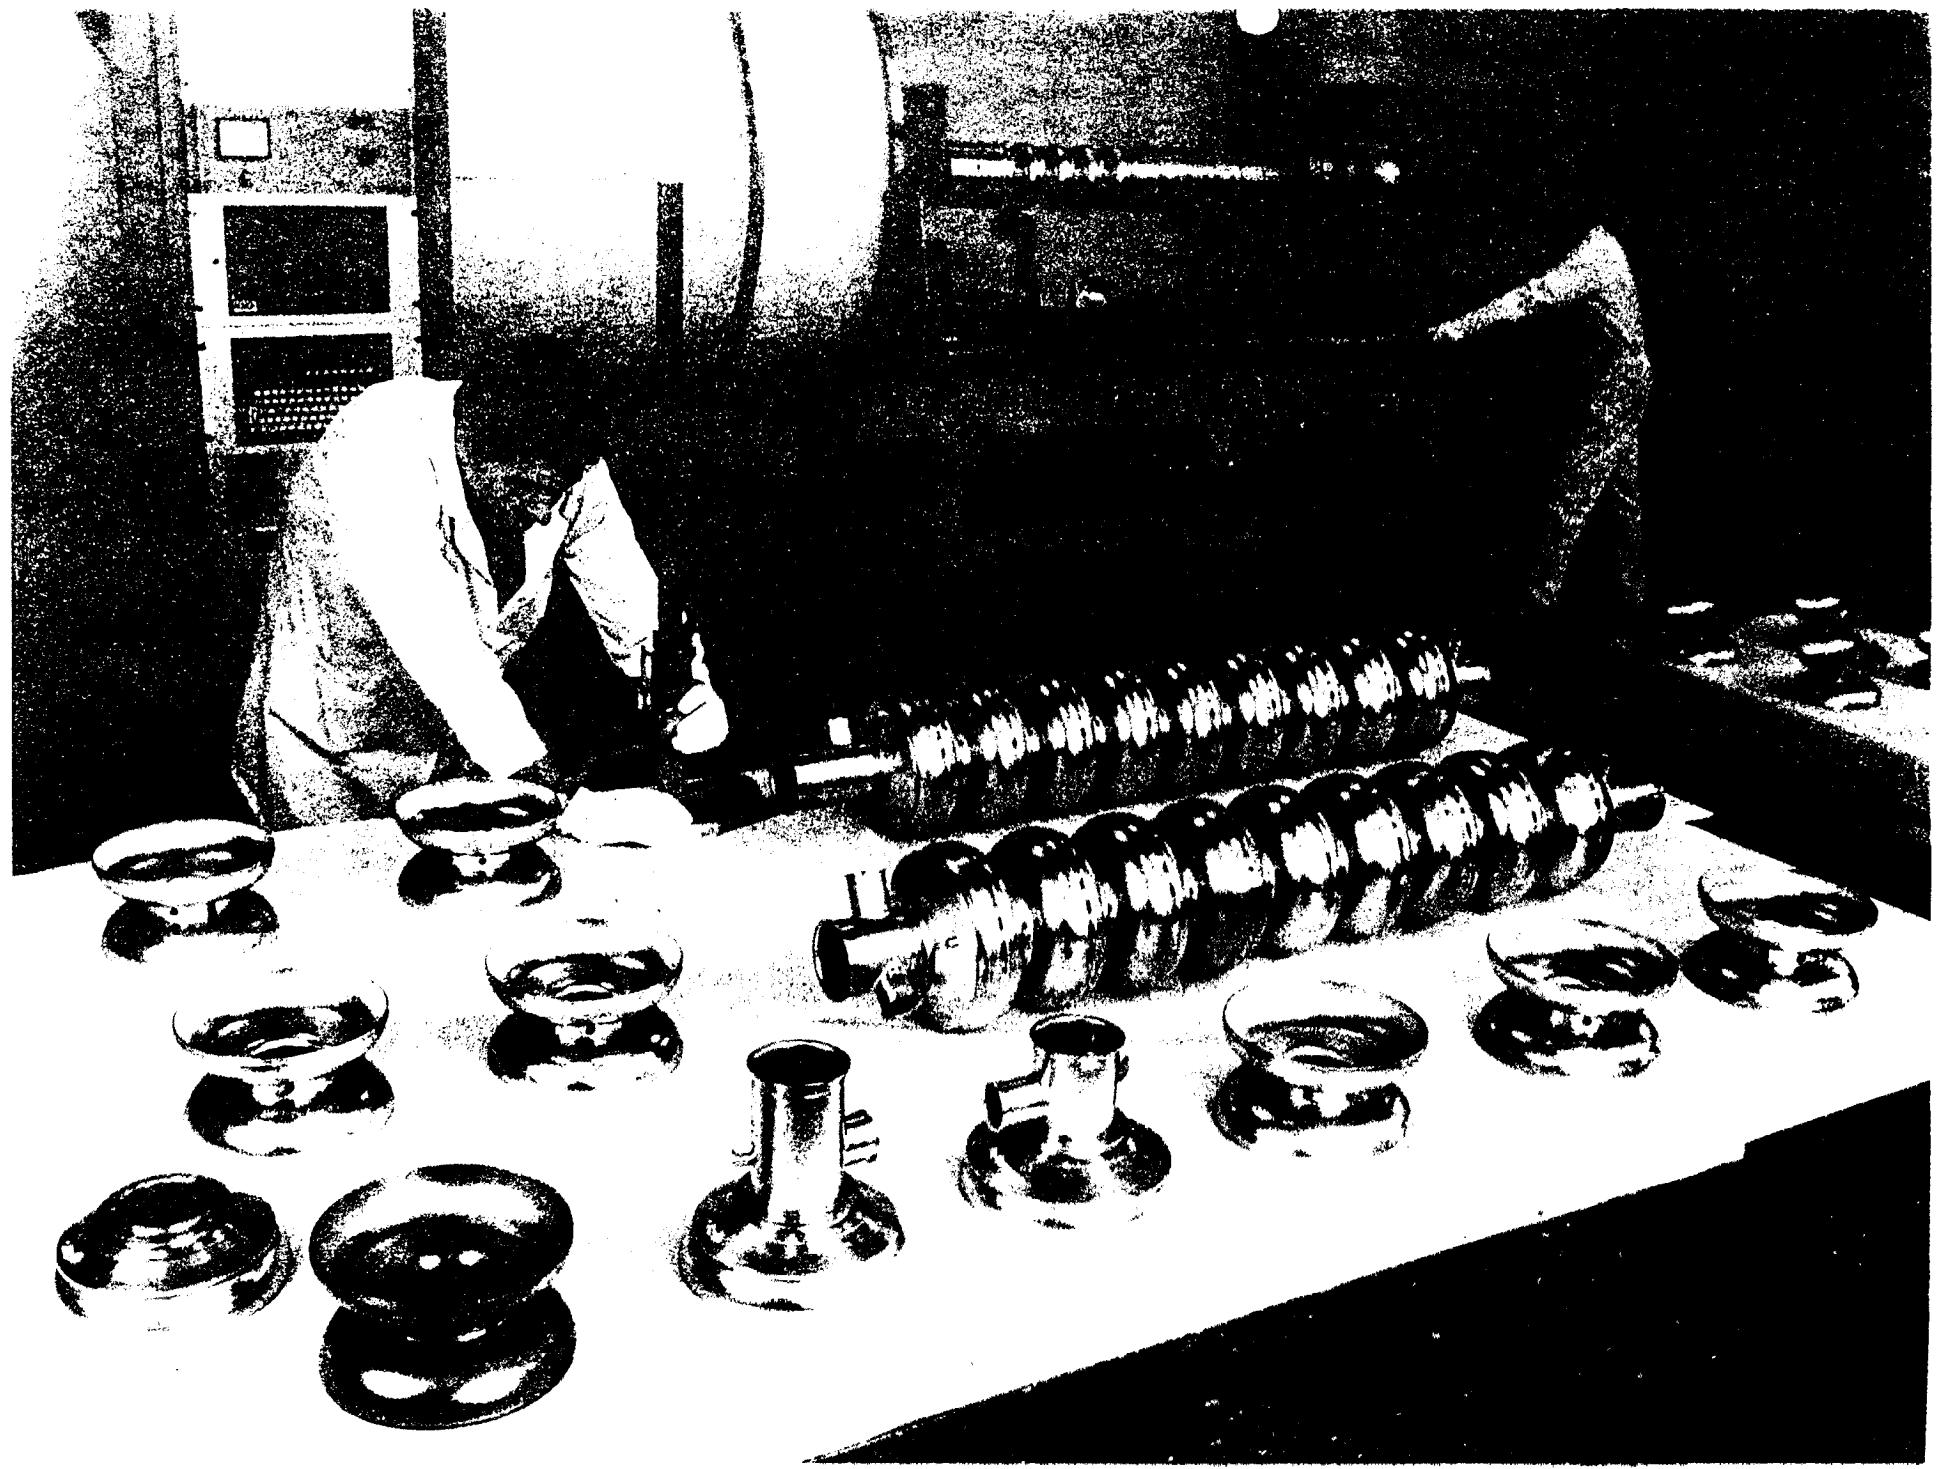

- Long modules containing 8 cavities plus sc magnets

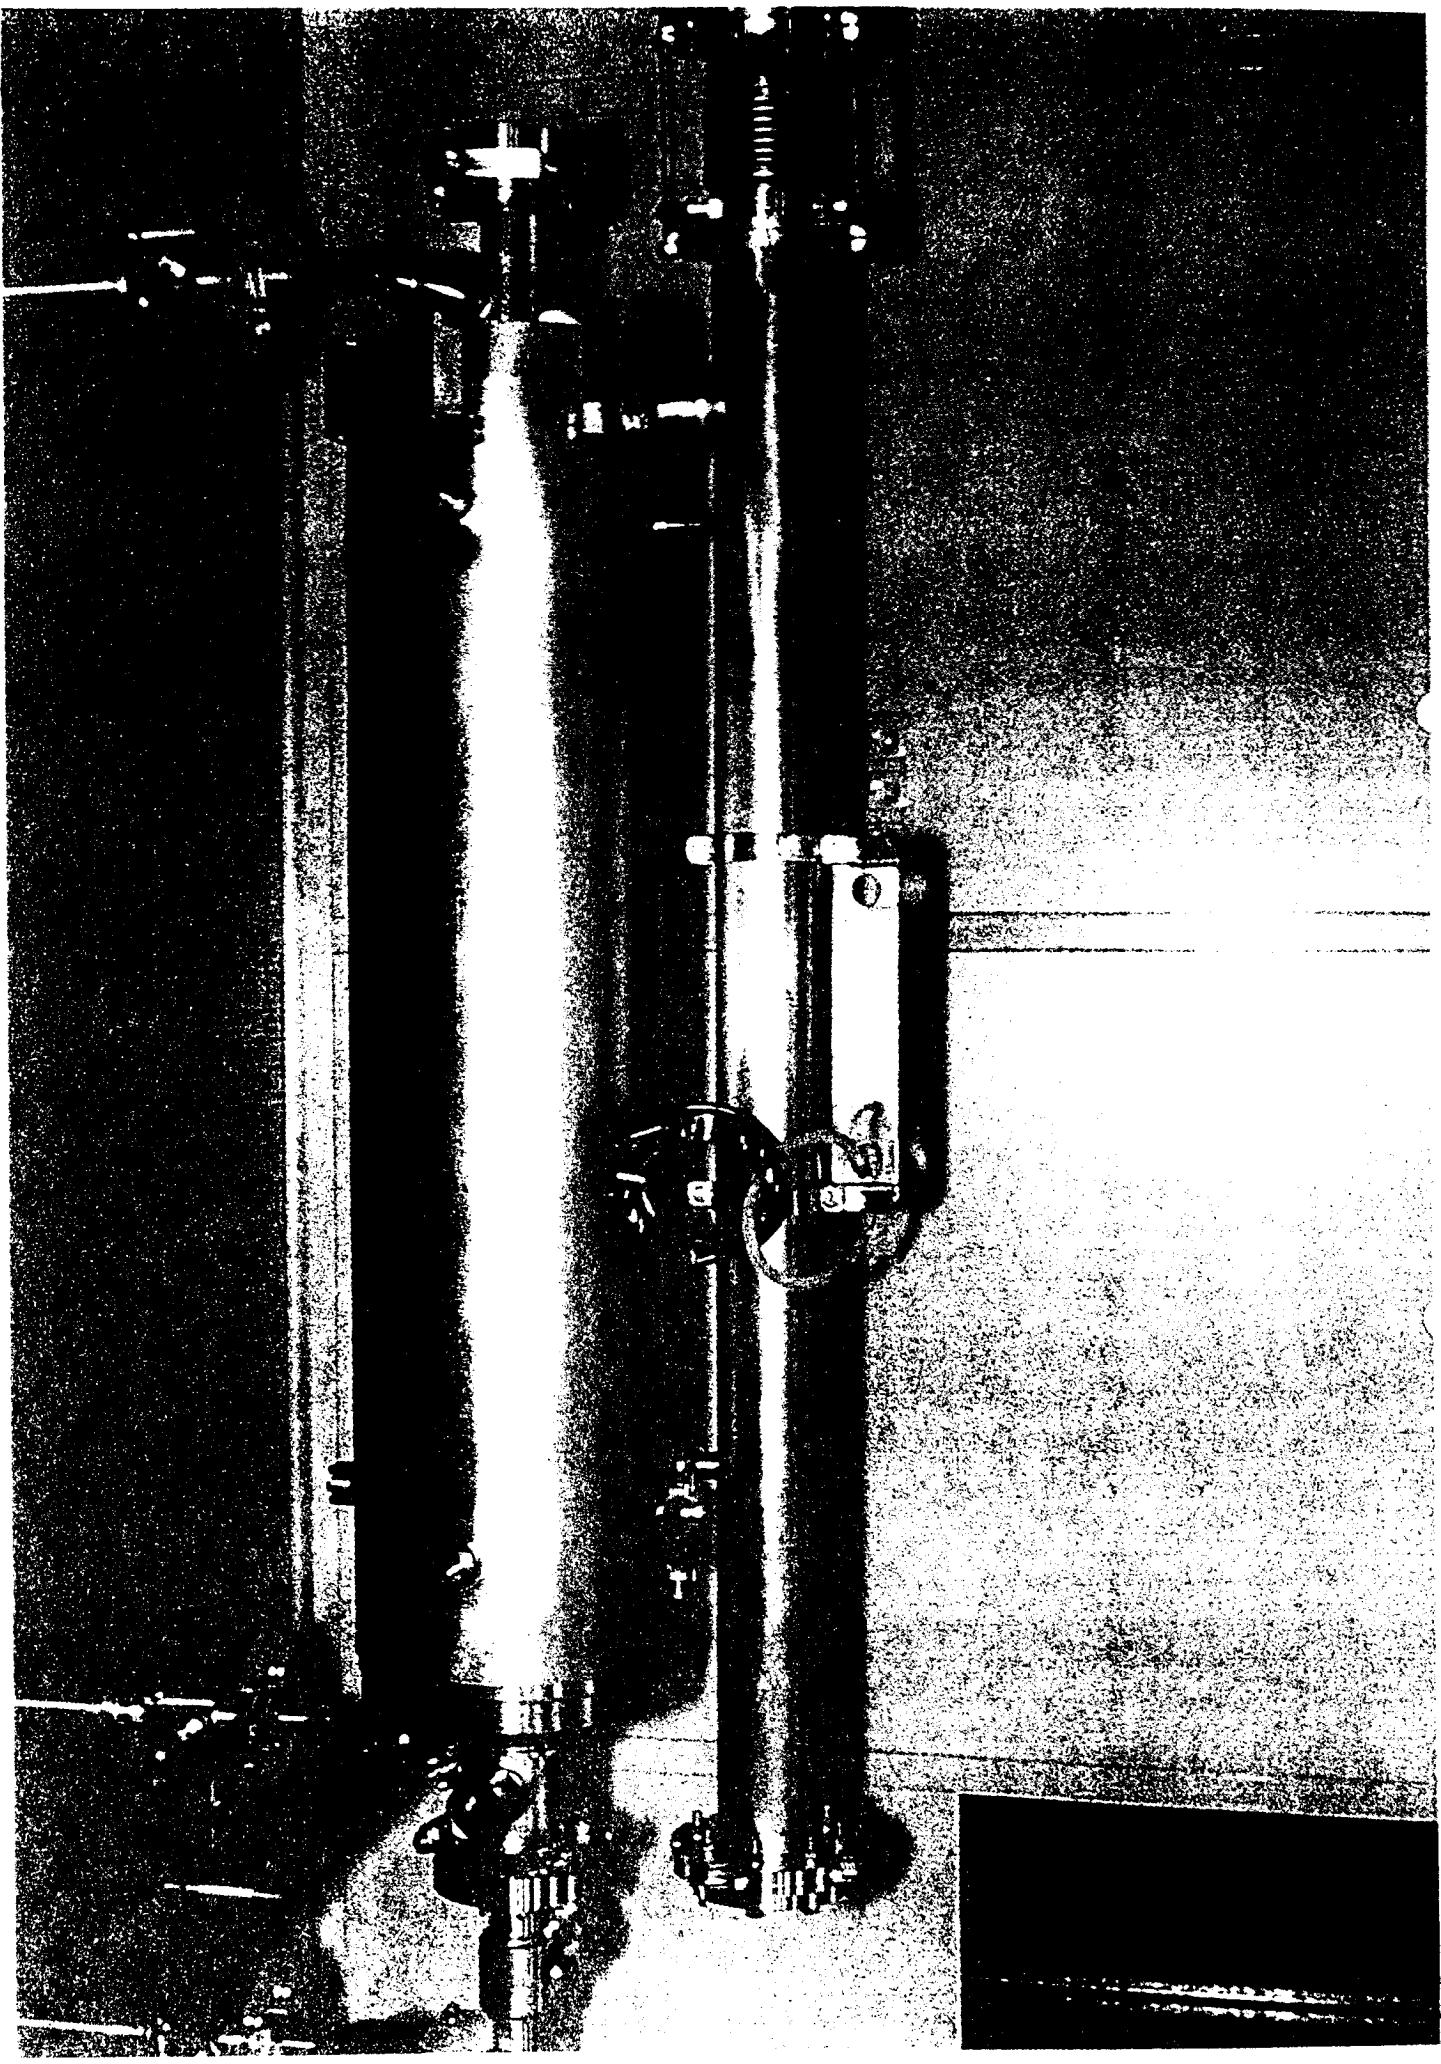

Connection of many modules to long cryogenic string (~2.5km)

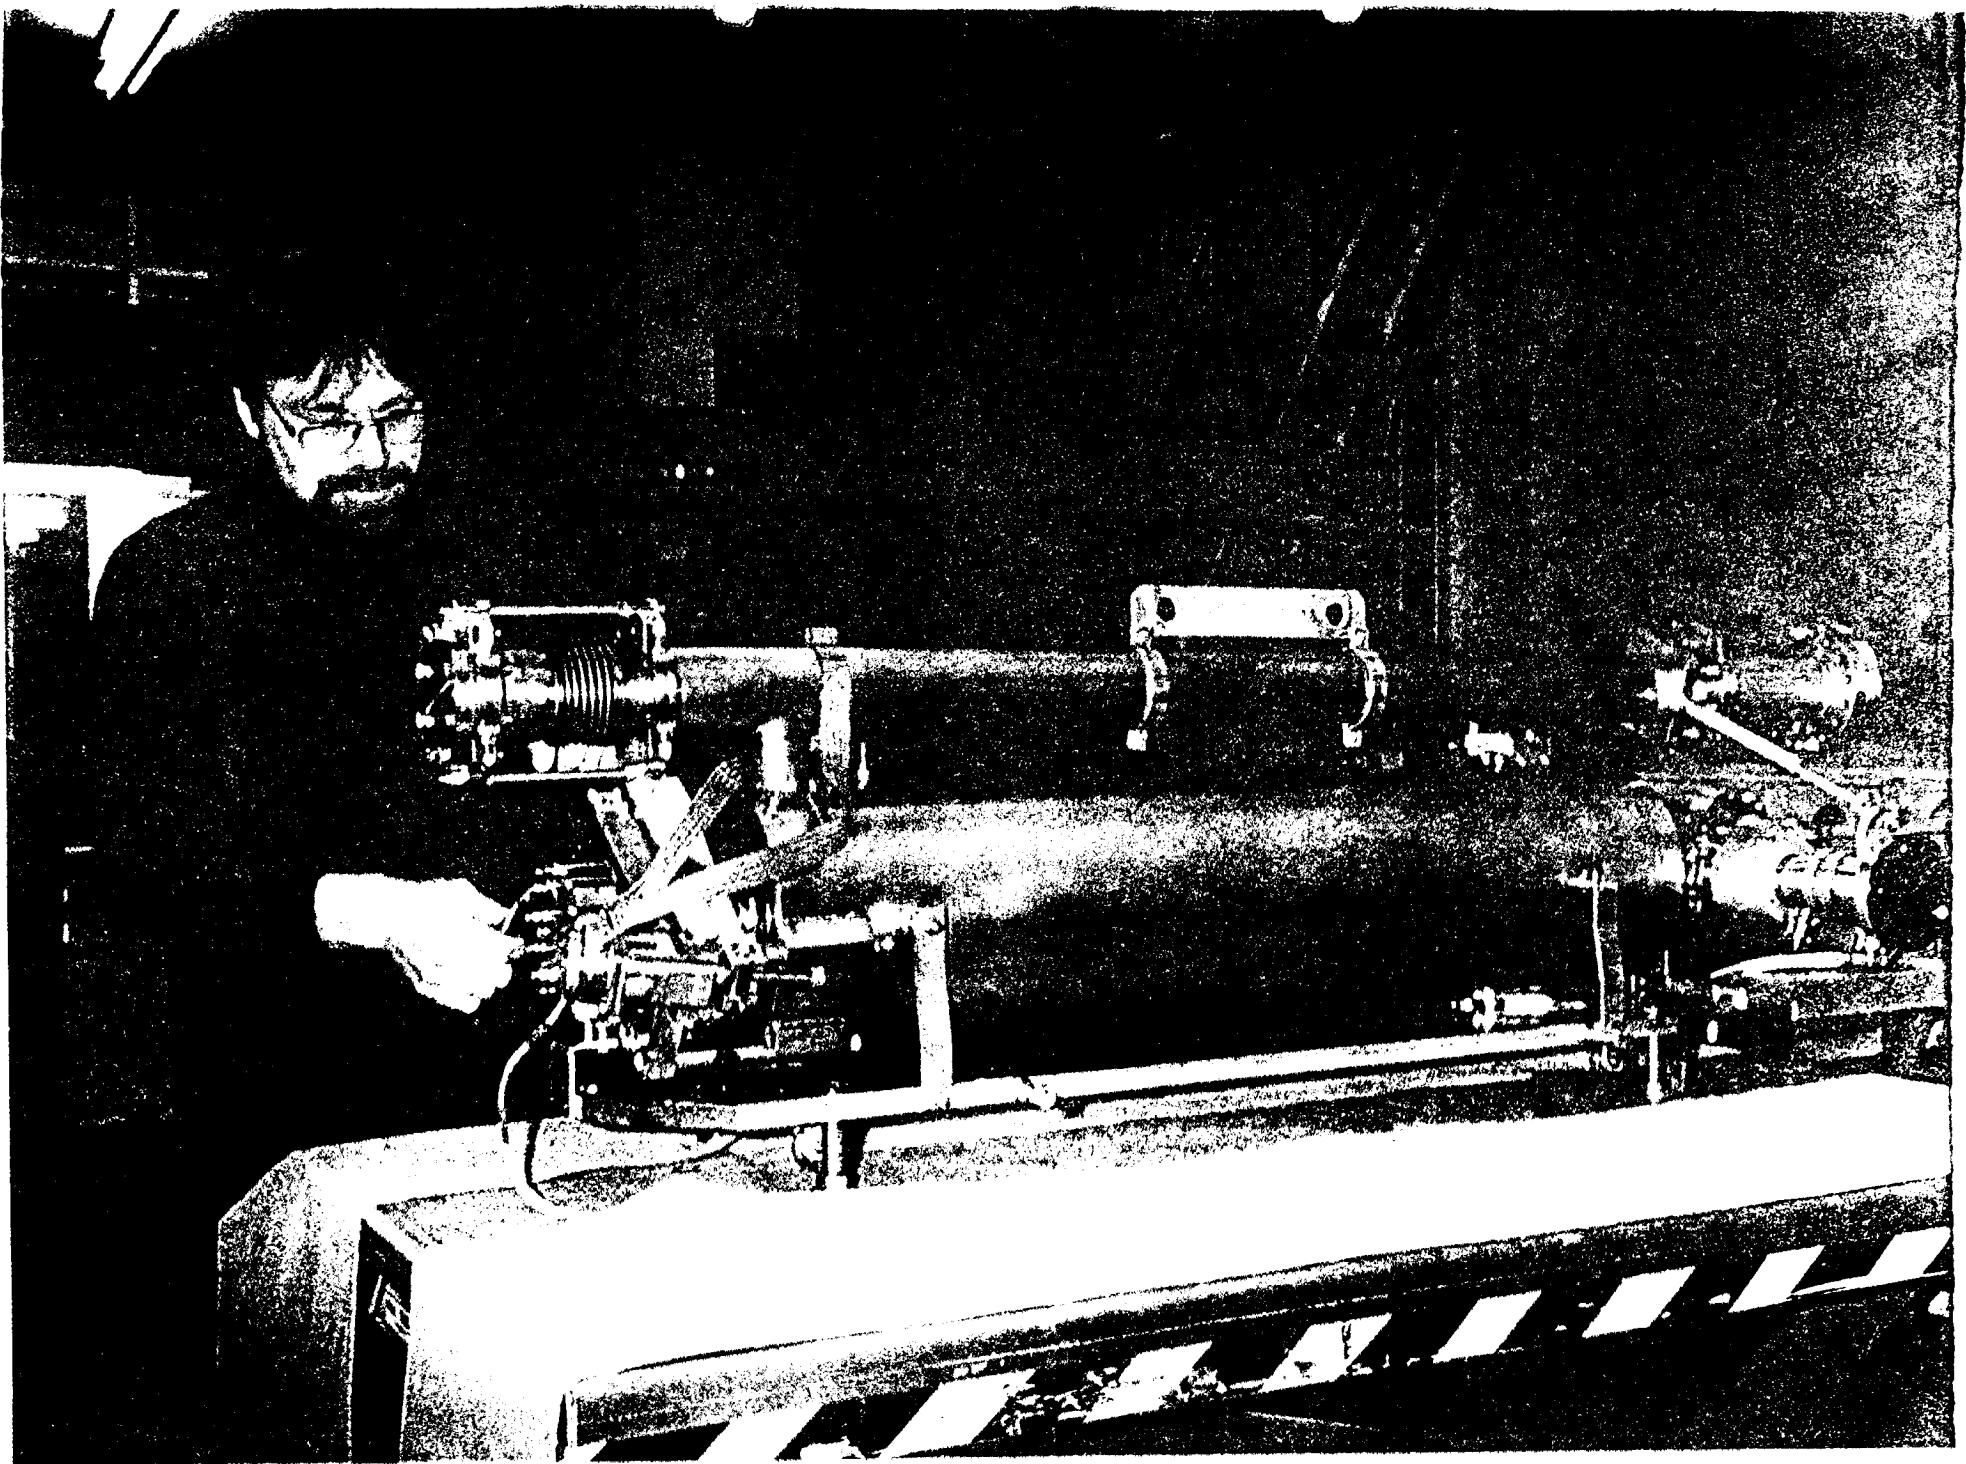

Incorporation of Helium distribution into cryostat

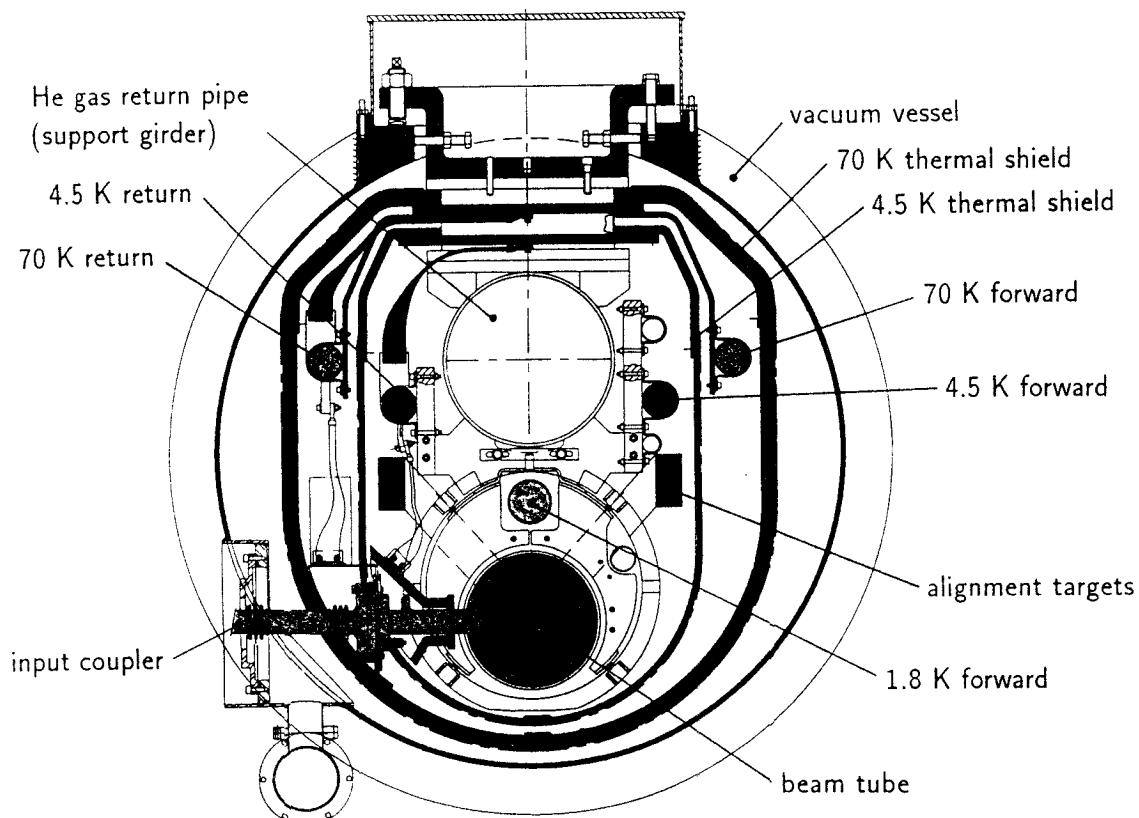

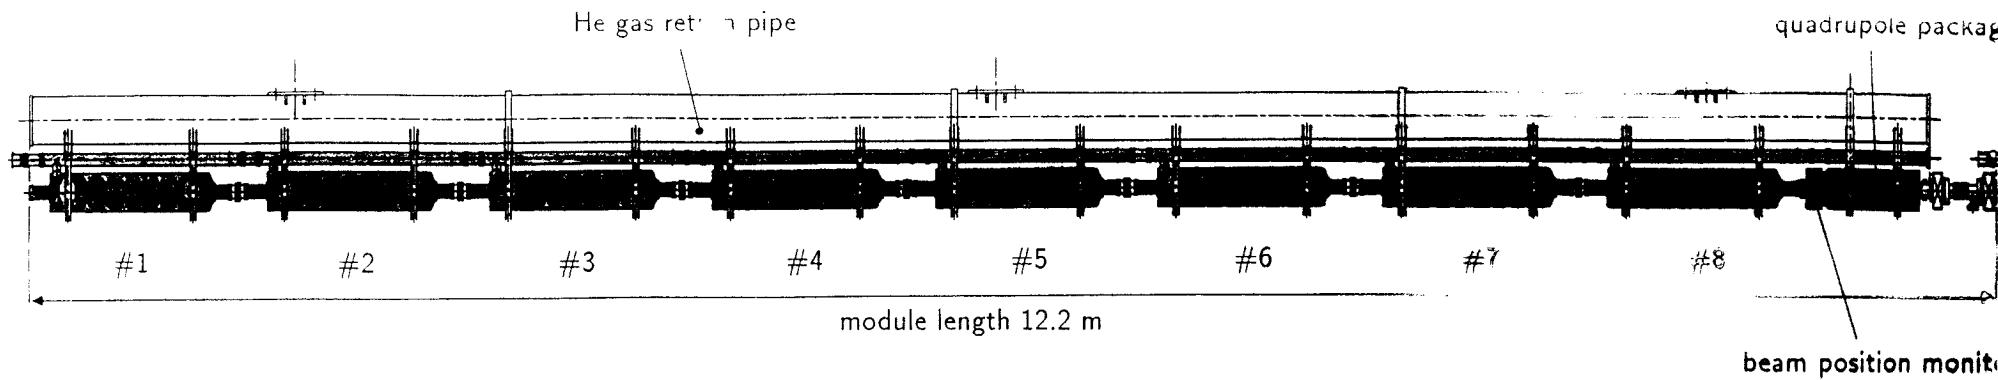

- Much cheaper and simpler Helium distribution system

No costly warm to cold transitions

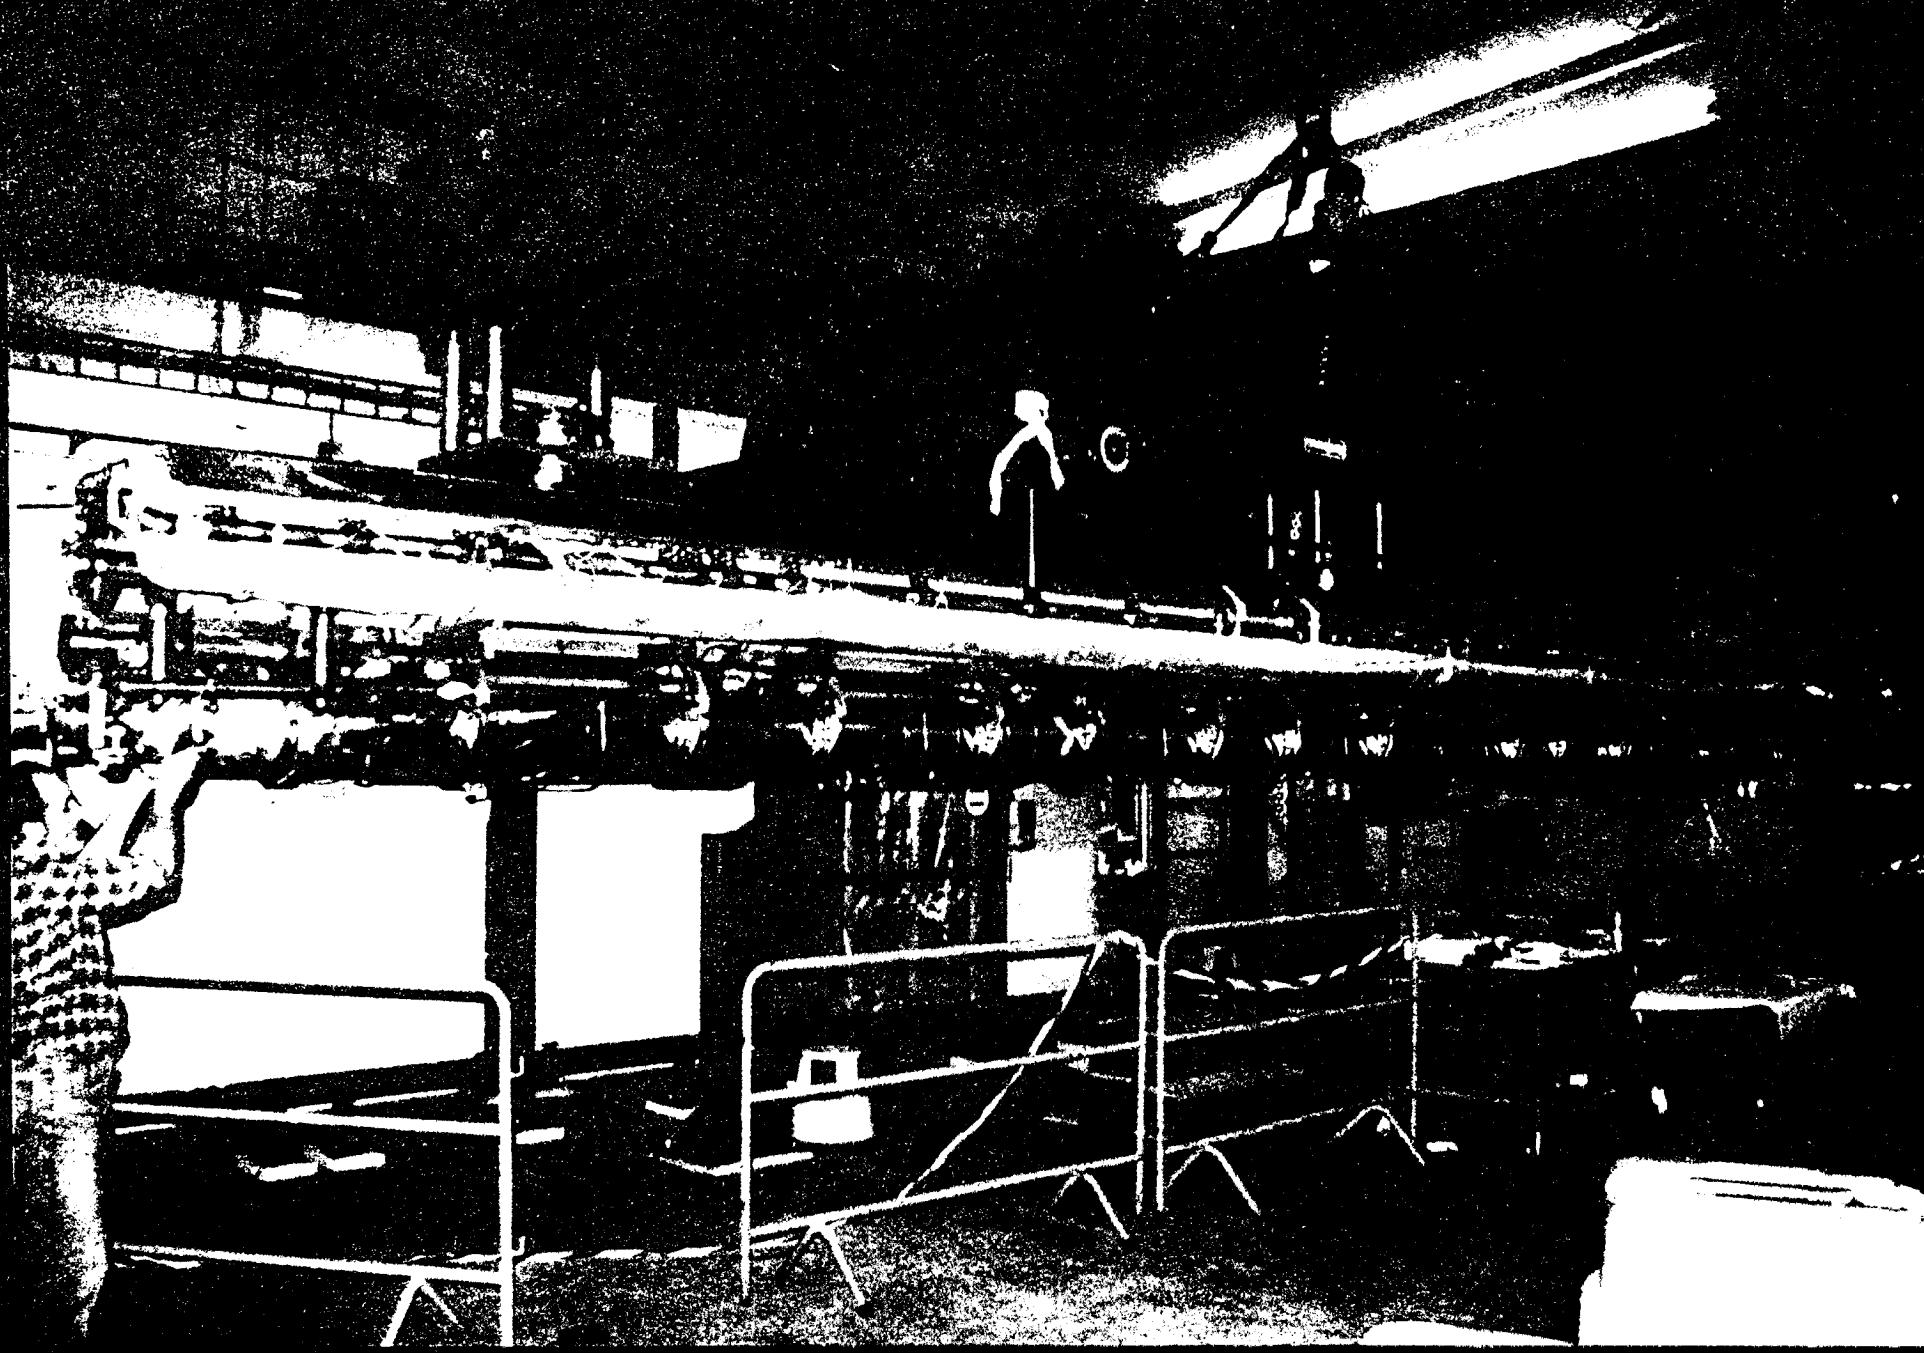

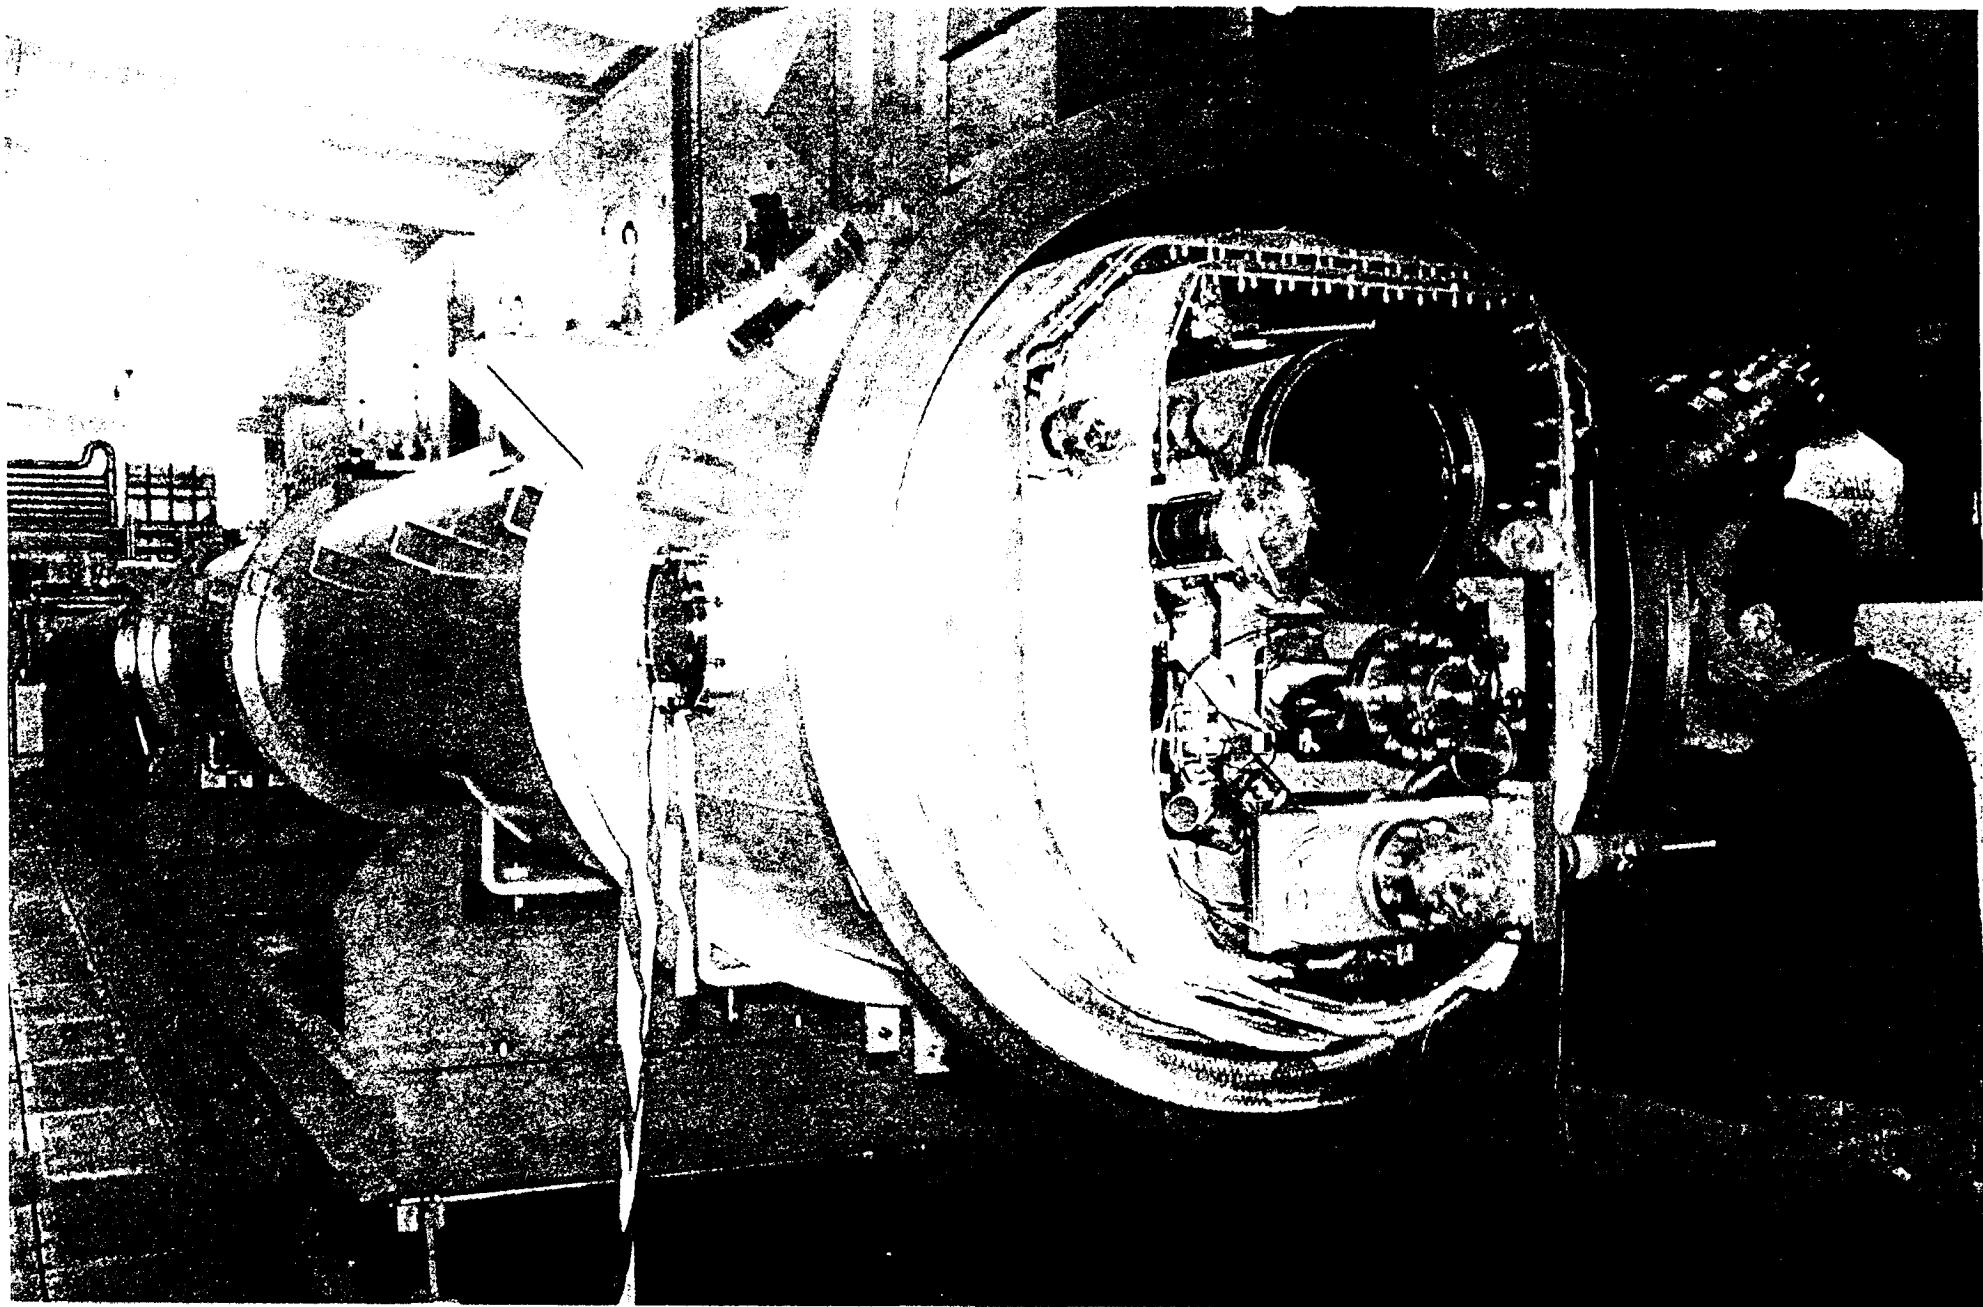

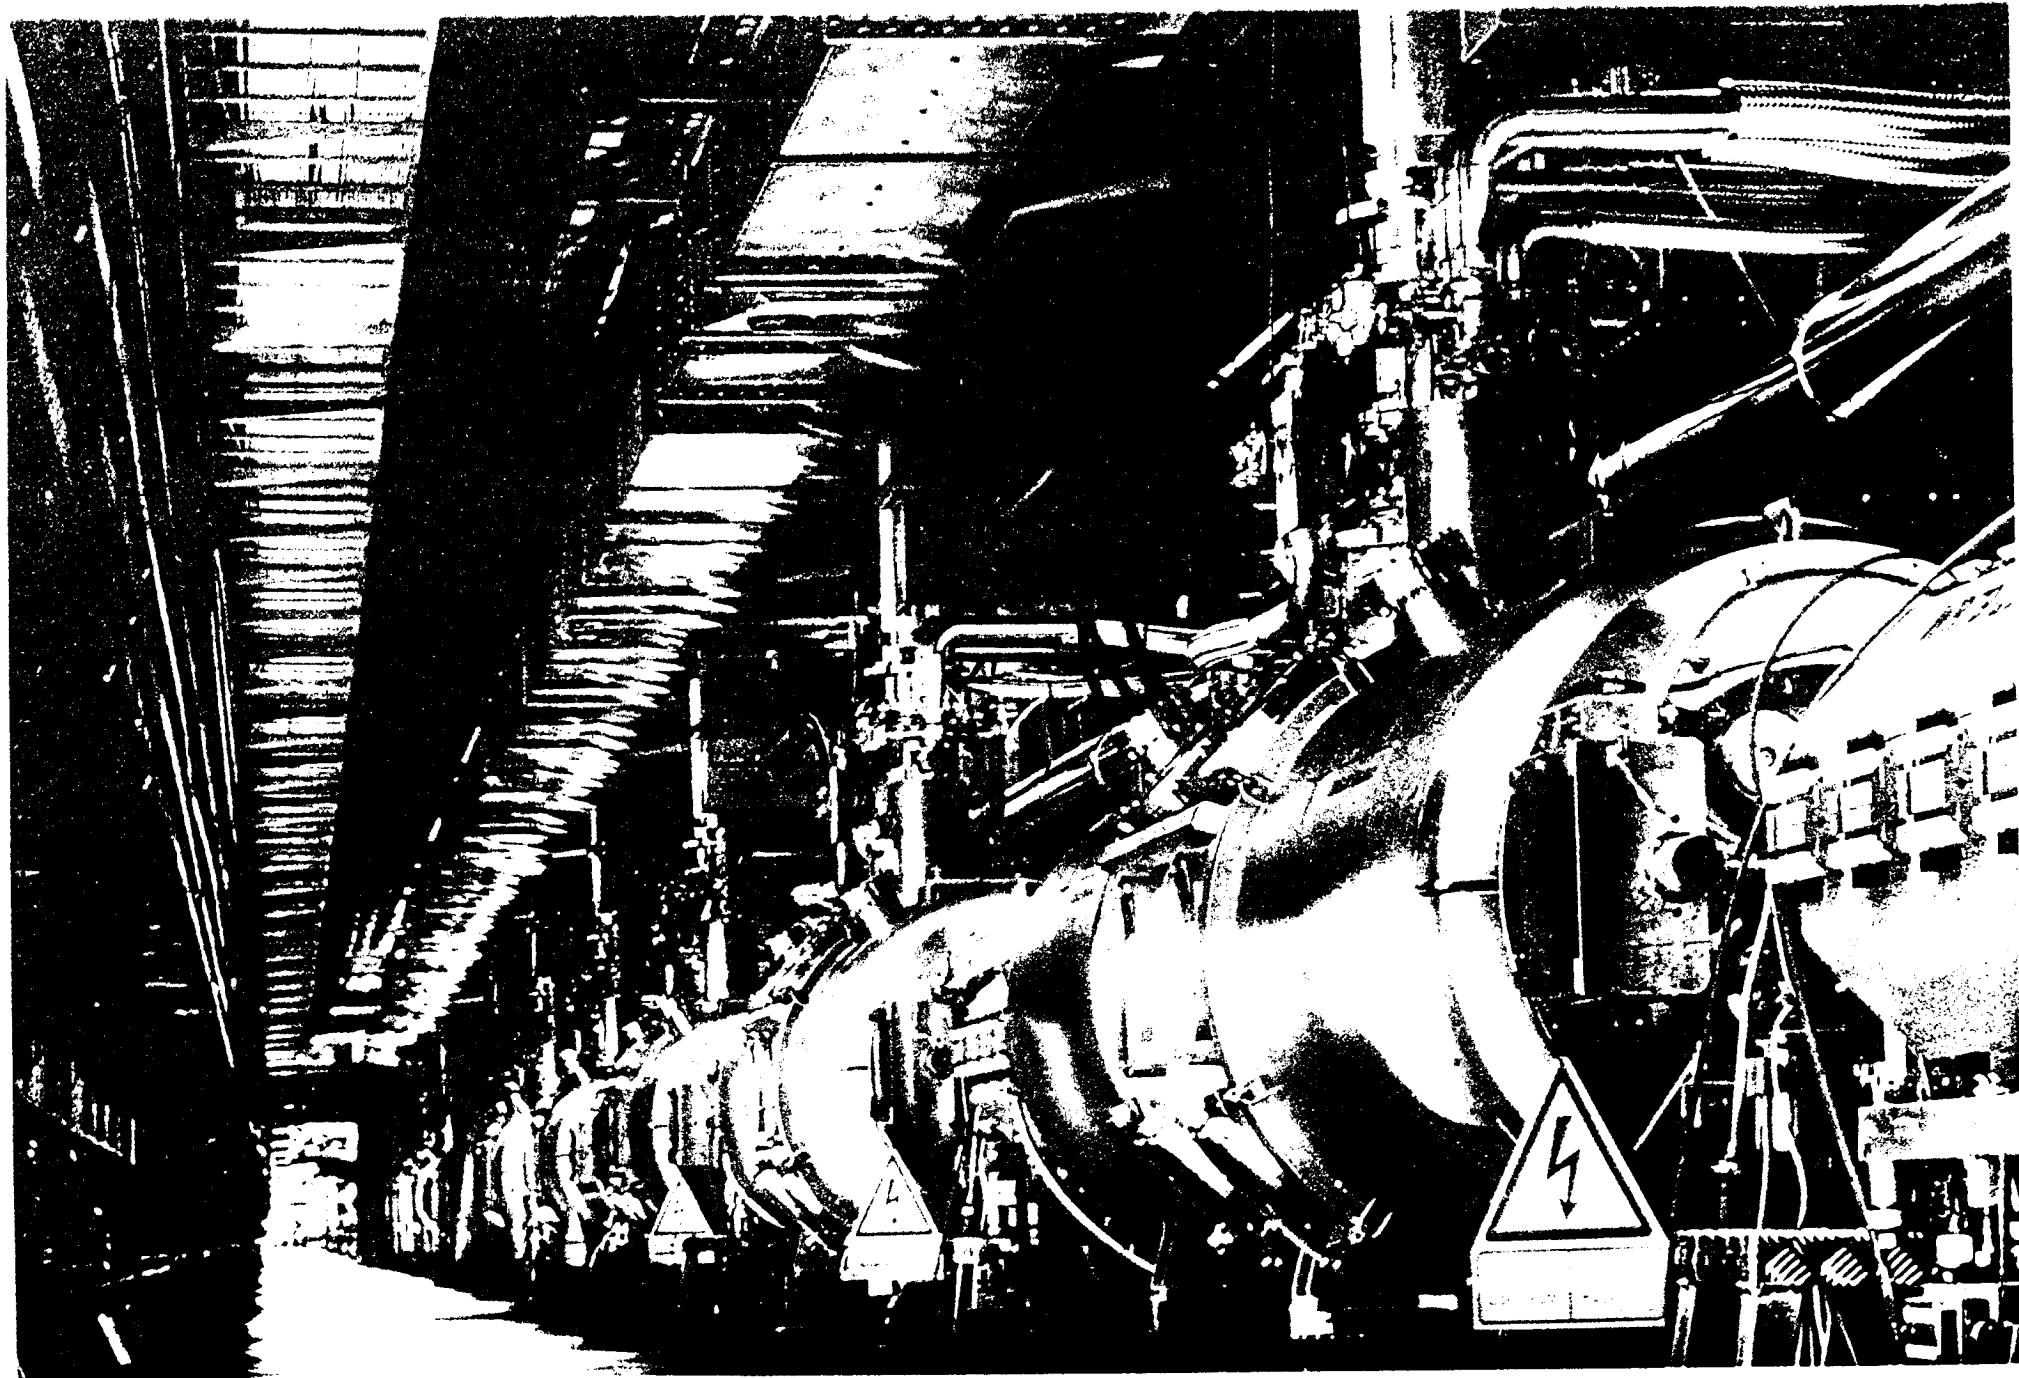

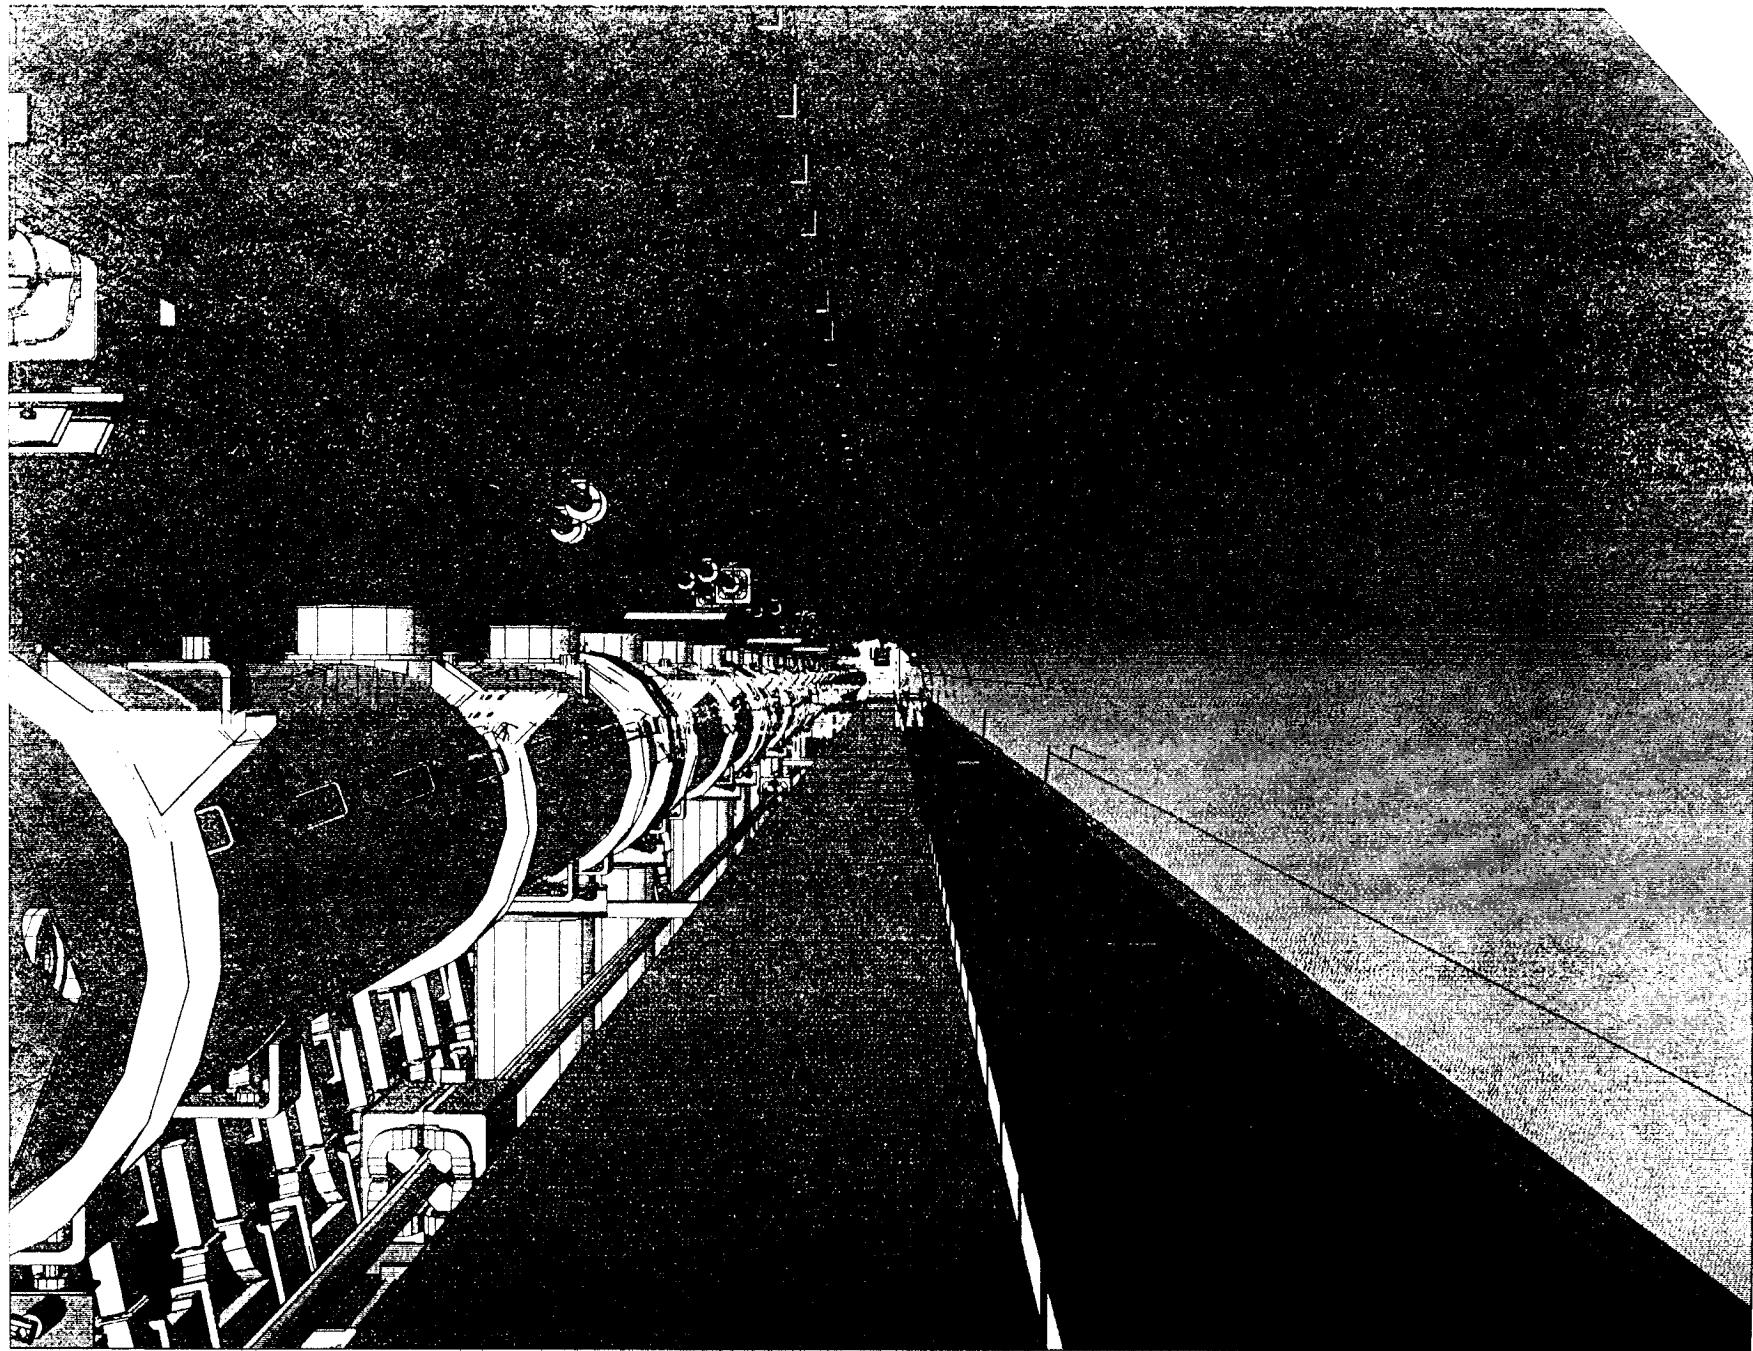

- He gas return pipe (HeGRP) is supported from above by three support posts (fiberglas pipe); it acts as a girder and is used for alignment
- the 8 cavities, the quadrupole package and aux.equipment are attached to the HeGRP by means of stainless steel collars
- two aluminium radiation shields are at intermediate nominal temperatures of 4.5 K and 70 K; they are cooled by means of flexible cooper braids connected to the centerline of the shield upper section
- the input coupler penetrate both shields and have special radiation shield 'cones'
- approx. 128 temperature sensors and 2 accelerometers are foreseen on the prototype cryomodule
- the anticipated static heat load budget for one cryomodule is

$\leq$	4 W	$\otimes$	1.8 K
$\approx$	14 W	$\otimes$	4.5 K
$\approx$	120 W	$\otimes$	70 K

A very important new development

" superstructure " concept

Spacing of adjacent cavities reduced from 1.5  
to 0.5 RF wavelength

Filling factor of linacs increases from

66 → 76 %

For fixed linac length required gradient for  
500 GeV

25 → 21.7 MV/m

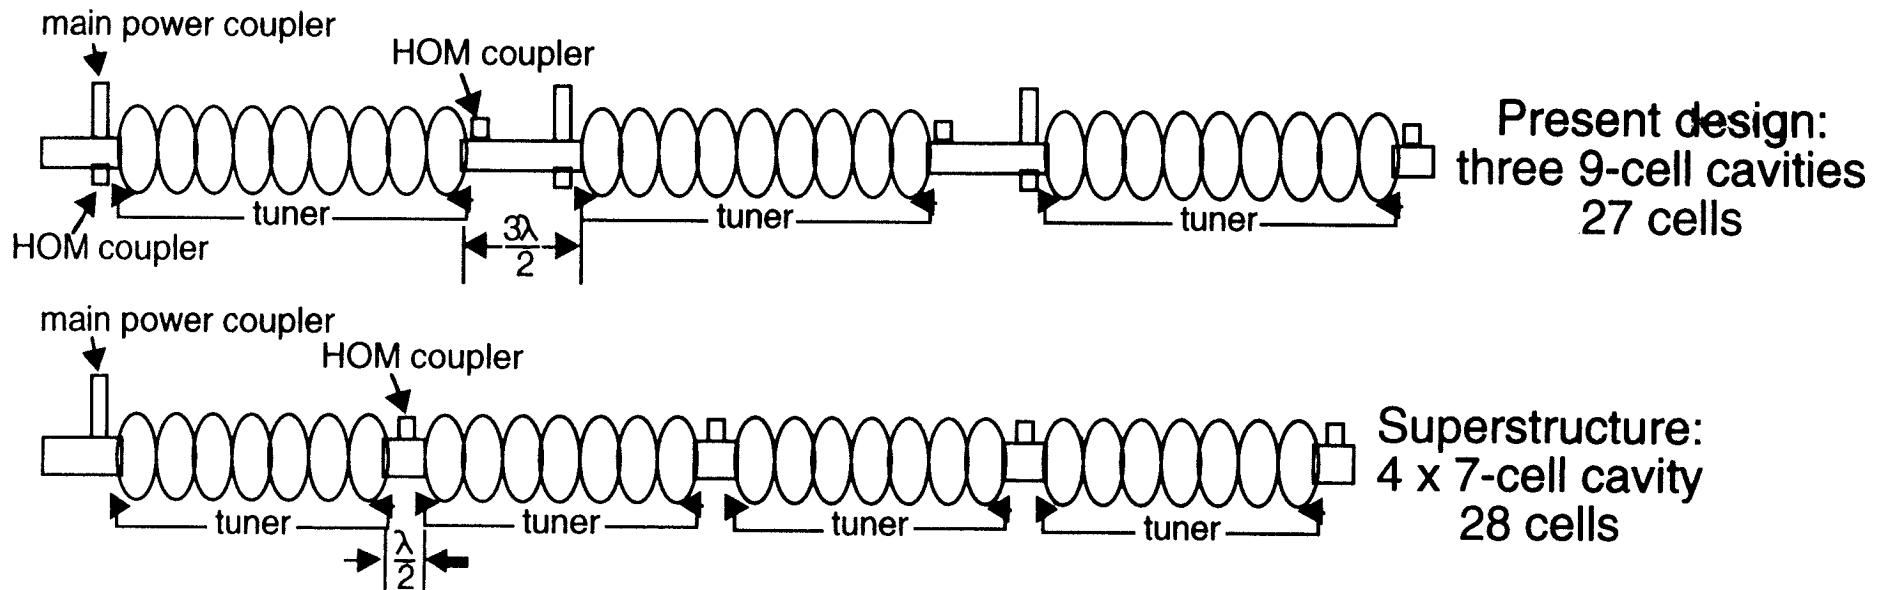

4 or more cavities are fed by ONE input coupler

Obvious cost reduction by

smaller number of    Input couplers  
                            Cryostat penetrations

simplification of RF distribution

# *TTF design <-> Superstructure design*

	TTF	Superstr.		TTF	Superstr.
cells per cavity	9	7	# FM couplers	19230	6181

beamstrahlung $\delta_B [\%]$	2.5	2.8
Disruption $D_y$	17	33
$P_{AC} (2 \text{ linacs}) [\text{MW}]$	95	95
efficiency $\eta_{AC \rightarrow b} [\%]$	17	23
luminosity $[10^{34} \text{ cm}^{-2}\text{s}^{-1}]$	0.68	3

## Benefit from "superstructure"

25 MV/m → 21.7 MV/m

allows for  $Q = 5 \cdot 10^9 \rightarrow 10^{10}$

These values are at hand already

Both effects lead to a reduction of required cryo power

Invested in the beam power

→ Lower loaded Q → shorter filling time of the cavities

→ Higher conversion efficiency for mains to beam power

17% → 23%

## Energy upgrade potential

With new "superstructure" concept the gradient needed for 800 GeV cm energy is 34 MV/m

From results of cavity R&D the optimism, that average gradients well above 30 MV/m @ Q-values of  $5 \cdot 10^9$  can be reached in the near future is justified

~~Most recent test in horizontal cryostat  
 $\beta_{ESR}$~~

33 MV/m @  $Q=4 \cdot 10^{10}$

WITH STANDARD  
TREATMENT

At constant cryo power rep rate 5 → 3 Hz vertical emittance reduced by factor 3

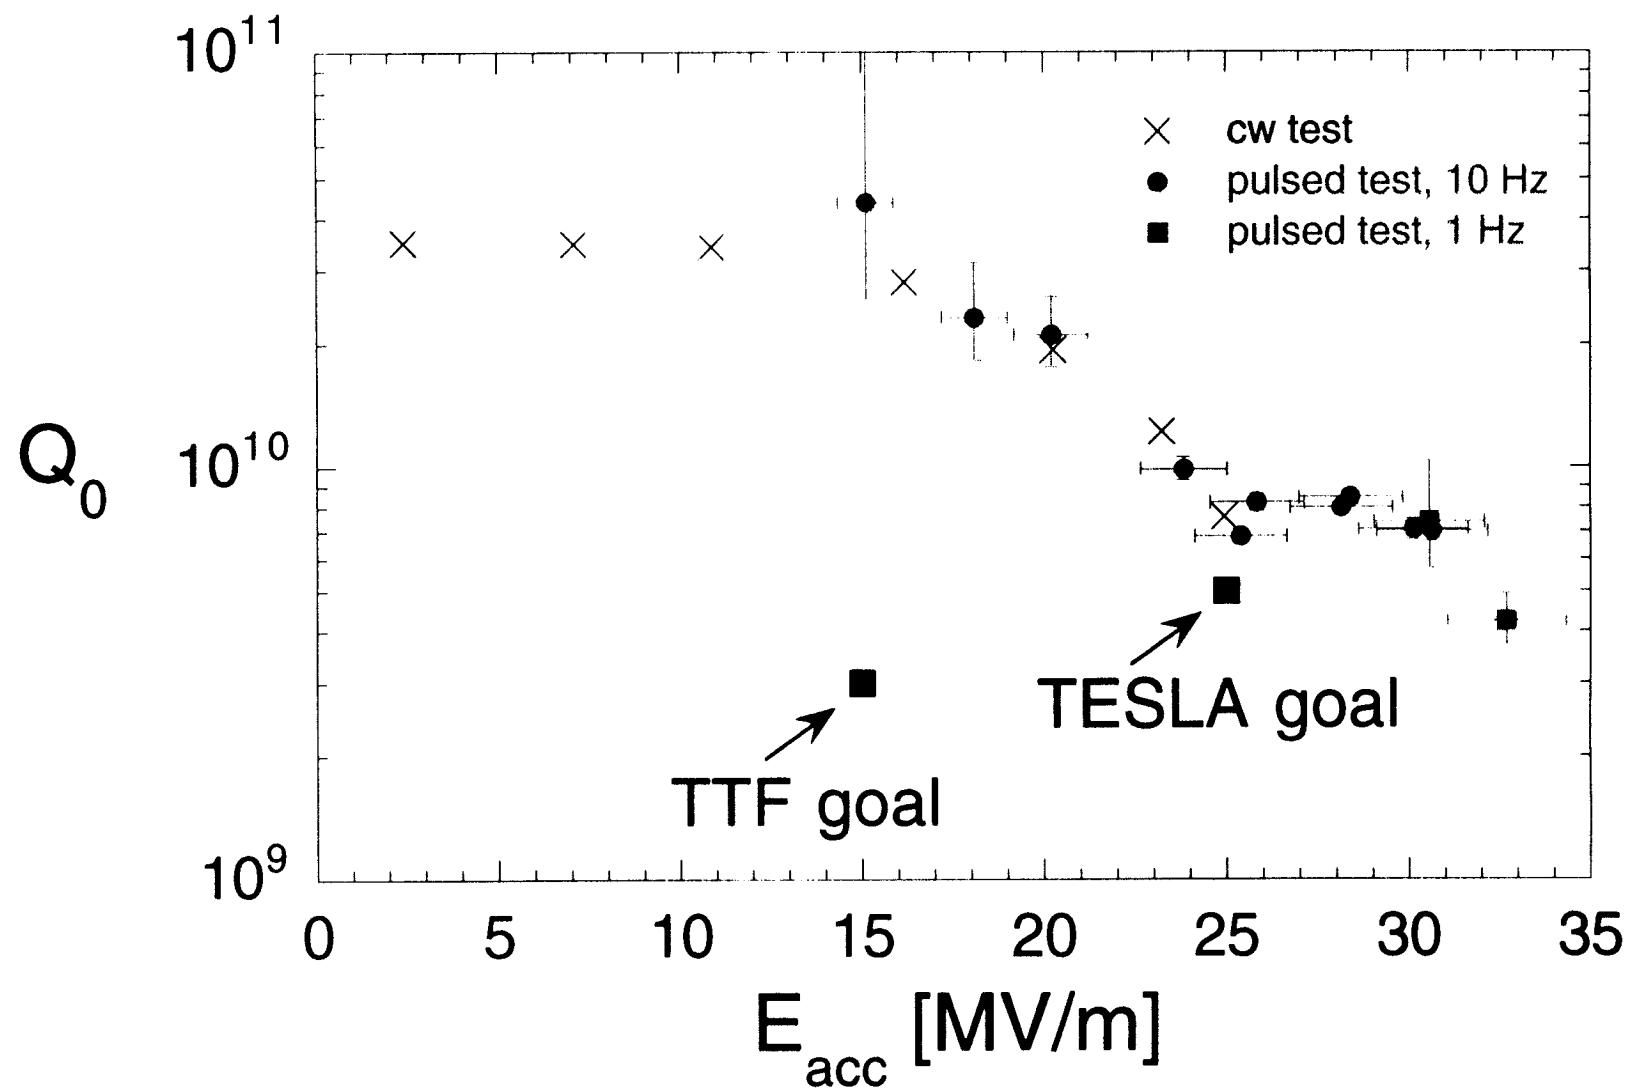

→ Luminosity  $5 \cdot 10^{34} \text{ cm}^{-2} \text{ sec}^{-1}$

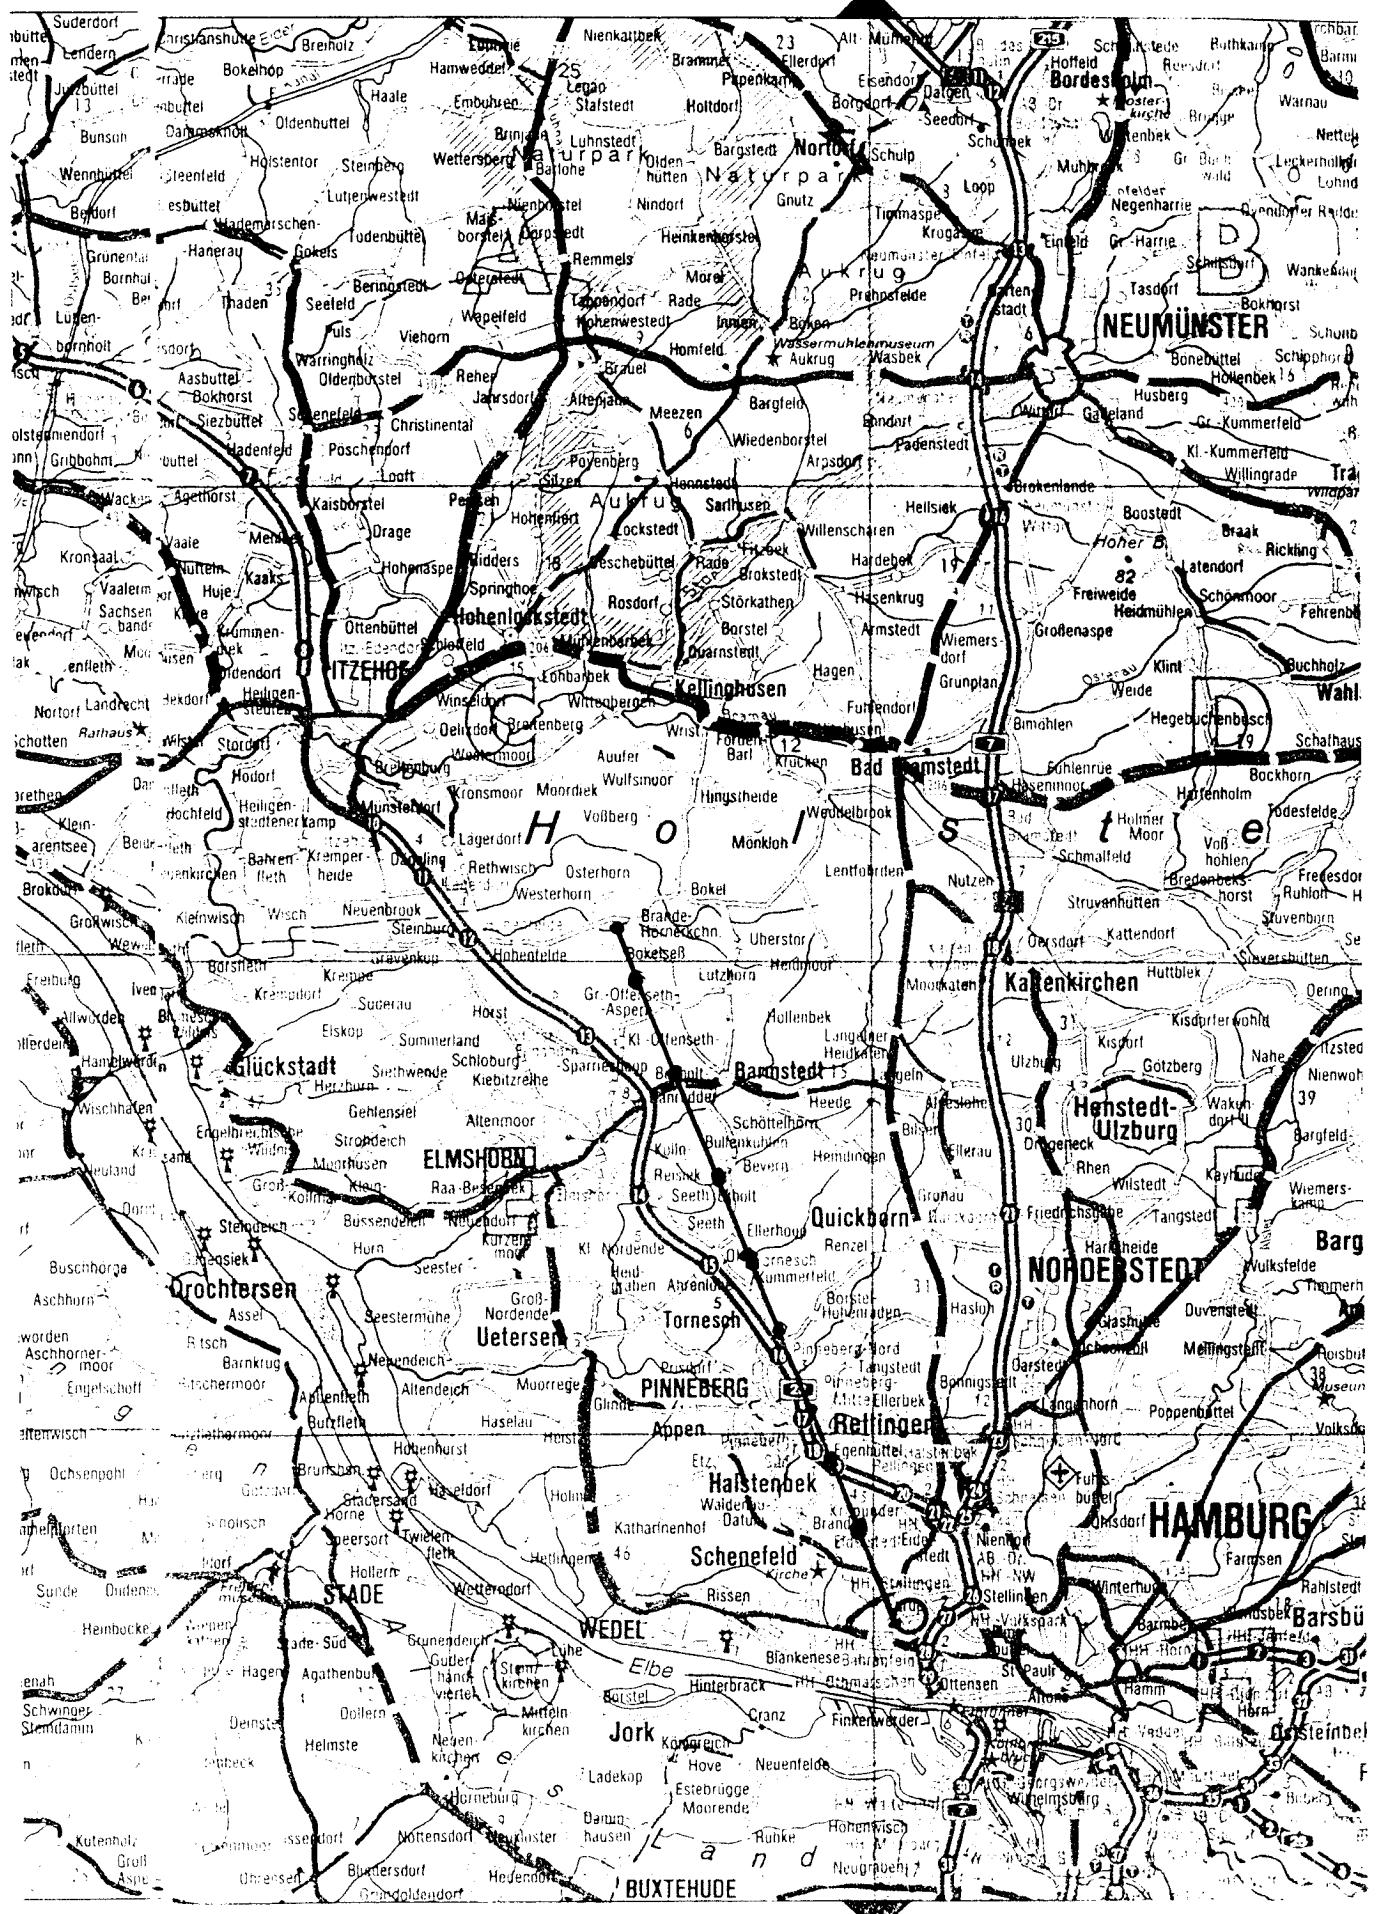

Upgrade of cryogenic capacity → rep rate 5 Hz

→ Luminosity close to  $10^{35} \text{ cm}^{-2} \text{ sec}^{-1}$

can be achieved

I-DEAS Master Series 3: Design

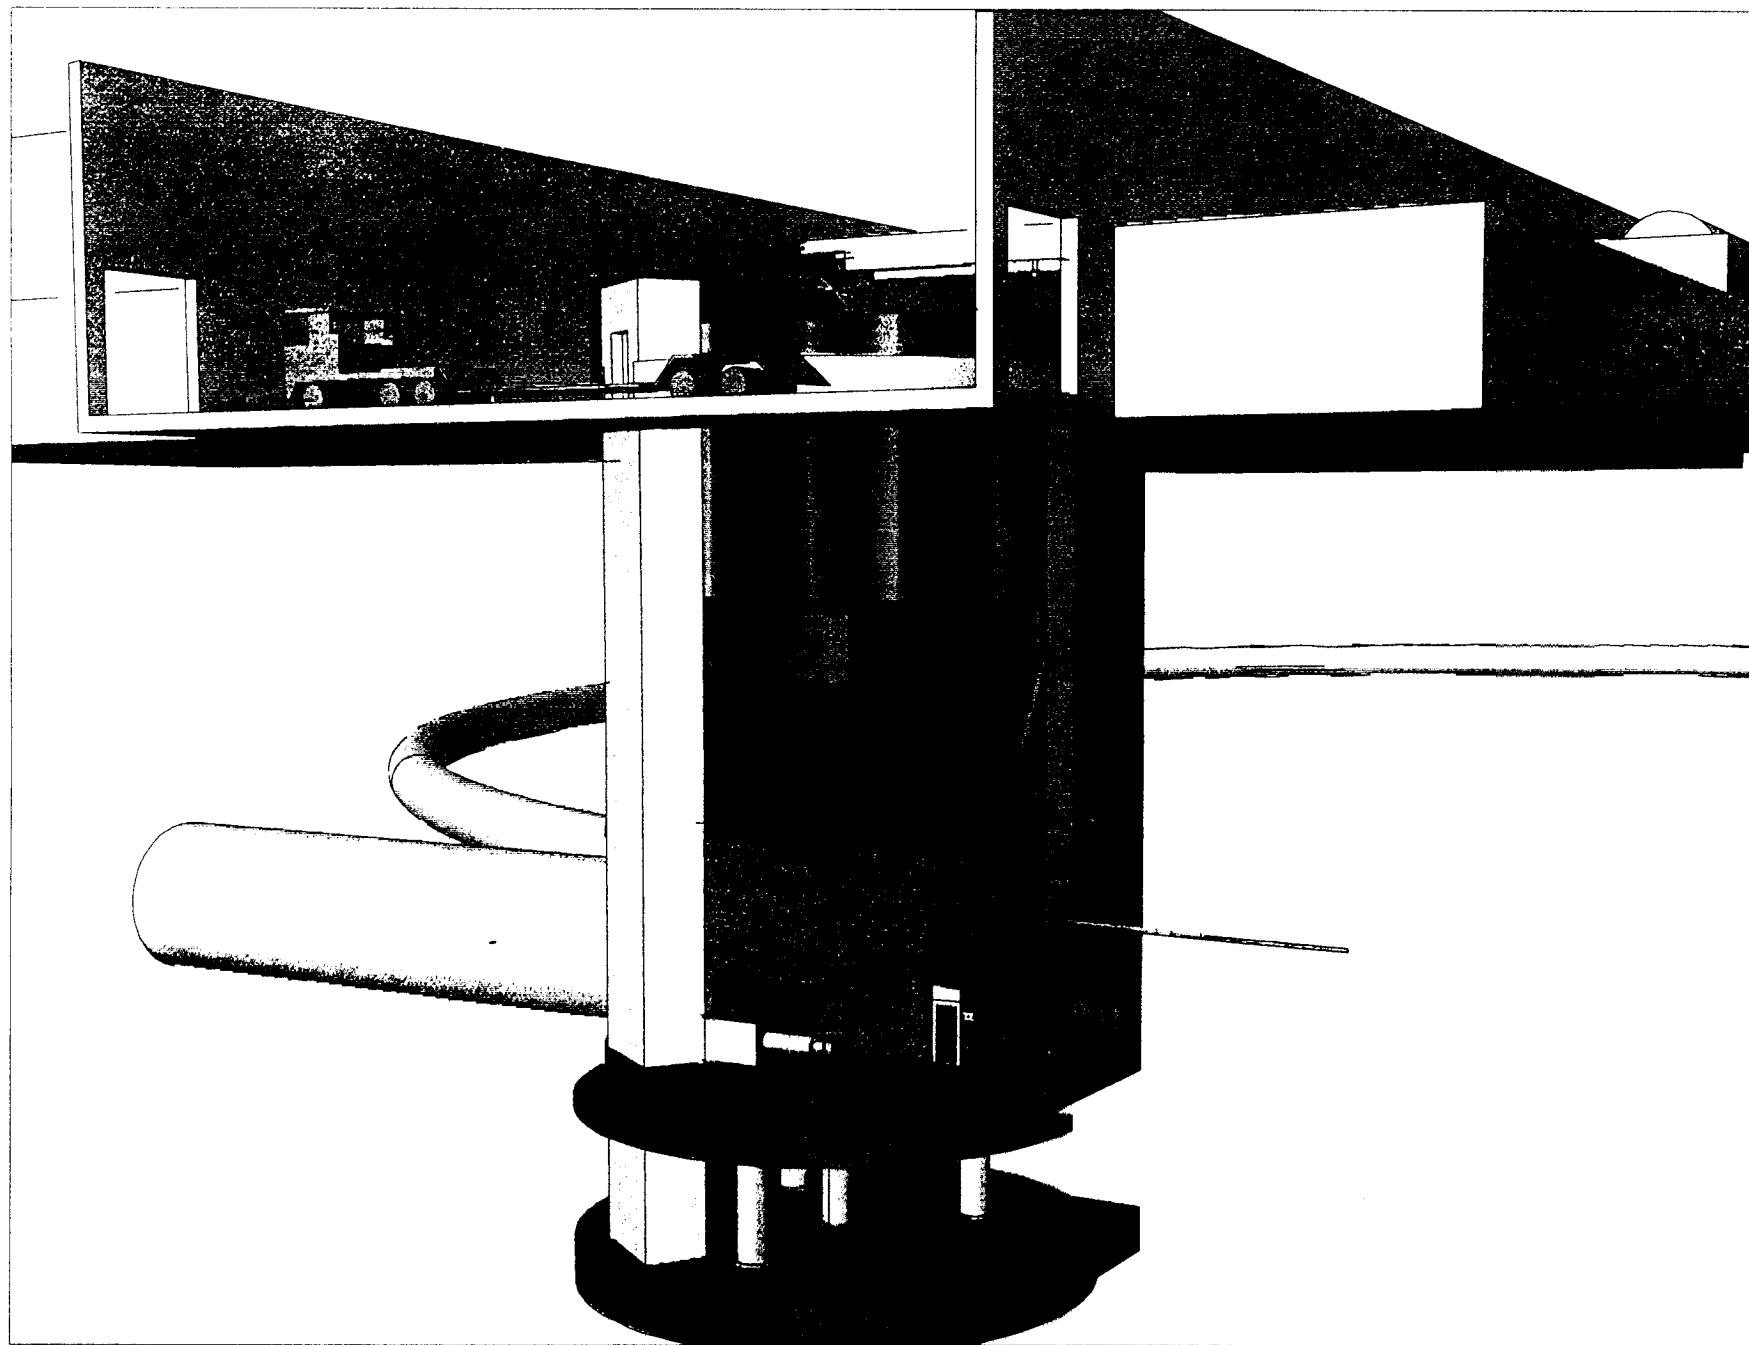

Date/Version : 0000/00000000000000000000000000000000  
View : PTP05

31-Oct-96 12:14:24

Units : MM  
Display : No stored Option

Want to have first cost evaluation of the whole project beginning of next year.

Also required manpower for the construction, installation and commissioning period.

INFN will design and evaluate  
damping rings  
cryostats  
cavity production

INR Troitsk will design and evaluate  
positron linacs

IHEP Protvino will design and evaluate  
beam dumps  
collimation system

Orsay/Saclay will design and evaluate  
injectors  
beam delivery system  
cavity production

Obtained results from two independent studies  
on cavity preparation to module assembly

Positiv: no problem to process 20000 cavities  
within three years

Surprise: fraction of personnel to total cost  
is dominant  
main part therein module assembly

differences between two studies have to be  
evaluated

Studies underway or in preparation:

cavity production with present technology

parallel studies by INFN and Saclay are envisaged

klystron production

modulator fabrication

wave guide production

## Road map

1998

treaty between Hamburg and  
Schleswig Holstein to jointly  
prepare legal conditions for  
the construction of TESLA

1999

fixing of scope for environmental  
impact study  
part of legal procedure

initiative to get evaluated by the  
German Science Council

2001

Technical design report including  
cost and schedule

Evaluation by Science Council
